decision to use only the natural machine word.
This is not very logic if programs are written specifically for that
machine! (as is the case with most GEM atari programs). But it is
logic if you want to run programs written for a general architecture to
run on your machine without alteration in a efficeint fashion. And that
was what the cray people had in mind.

1649. ST Memory Write Cycles

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-24 12:26:25 UTC
From: "Gerry O'Rourke"
Message-ID: <1993Mar24.122625.23338@bmers95.bnr.ca>
Source record: 39702

I am working on upgrading the memory in my STFM (IMbyte) & I want to use some memory devices (because I have some handy) that are of a different configuration to the 256Kbit devices on the motherboard.

I need some information on the memory write cycle, like does the ST use an early write cycle (assert WE before CAS) or delayed. I have looked at some of the old texts on memory upgrades, but I don't see the information I need. Maybe someone has done this already or knows of a detailled description of the ST memory cycle.

Please E-mail replies, as this subject is probably not very topical.

Regards

Gerry O'Rourke

Message-ID: <1993Mar24.4019.10779@dosgate>
Source record: 39703

Can anyone help me understand what is happening with my ST?

It began when Universal Item Selector suddenly stopped working. I couldn't re-install it, no matter what. I tried new copies, everything, but during the boot process it showed bombs and refused to install. Even running UIS from the desktop gave bombs.

I thenstarted using Selectric, a German file selector. It loaded from the Auto Folder, and generally worked OK. But when it tries to copy multiple files, it corrupts the target floppy.

Another peculiar thing is that copying a file from the desktop often results in no copy. It takes several tries to make the copy. Also, when I read a text file from the desktop, I have to scroll through the whole text; the escape or undo key do not abort the process.

I can't take the machine into the shop at the moment. I'll have to use it in the crippled state it's in at the moment. But I would like to understand what is going on a little better to see if I can find ways to work around the problem.

1652. Problems with MiNT 1.04 / TOSWIN 1.4

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-24 15:35:57 UTC
From: jensk@hpbbn.bbn.hp.com
Message-ID: <JENSK.93Mar24083557@hpbeo82.bbn.hp.com>
Source record: 39705

I managed to compile MiNT 1.04 yesterday, but I have some problems with it.
I'm running it on a 4MB ST.

Problem 1: If I start a tcsh in TOSWIN, the system crashes after less than
1 minute, even if I just sit there looking at the blinking cursor.
The crash is caused by an address error; the PC displayed in the
error message is corrupt (seems to contain instructions instead
of an address), but I don't know how accurate that message is.

Problem 2: Pressing ESC on the desktop sometimes, but not always, produces
a crash that causes MiNT to halt. I haven't yet found a way
to consistently reproduce this one.

Has anybody else seen these? Does anybody have a fix?

Thanks in advance,

Jens.

>think it's a good idea.

Something of a diversion which has little to do with the argument:

It's been interesting for me to follow the discussion on this topic, which basically comes about from C's poor type model. Your Pascal ranges are nearly right, but they're a bit of a hack too. The best type model I've seen for modelling exactly this sort of problem is Ada's.

You can create new types explicitly by giving a range:

```
type BYTE is range 0..255;
```

No need to rely on any predefined type. You can make sure that a BYTE is implemented as 8 bits by telling the compiler:

```
for BYTE'SIZE use 8;
```

This sort of thing is extended to floating point, too:

```
type SOME_FLOAT is digits 8; -- 8 significant figures
```

And fixed point as well:

```
type SOME_FIXED_TYPE is range 0.0..100.0 delta 0.1;
```

It is precisely the sort of problem that has been quite eloquently described in this thread that these constructs remove. Perhaps it's about time the world learned that there's more to portability than everyone using the same C library interface.

1655. TOS 2.06 Window Slider Messages

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-24 20:24:15 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <107480016@hpfcso.FC.HP.COM>
Source record: 39719

Anyone know what the deal is with the window scroll bar messages sent under TOS 2.06. Code I wrote under TOS 1.0 would send one message when the up arrow was clicked. Now, with TOS 2.06 my code receives two messages for every single click. Another person posed this question because they noticed that Opus was doing the same thing. The bottom line is that there is no way to use the up arrow to advance one line. The only responses were to get a kludge that copies all of TOS to RAM. This is bull shit in my opinion because other commercial programs work just fine.

What is the secret to ignoring the second message.
How do you know which message to ignore (say you held the mouse button down and auto repeat keeps sending messages).

Is the answer to just ignor every other slider message?

Ted.

That's very nice. Why don't you go off and start porting an ADA compiler
to the ST? In the meantime, the rest of us will continue to hammer out
the details of an interface in the language that is responsible for the
bulk of the serious work that gets done on this machine.

(What's that? You say you can't do a compiler yet, because committees
are still quibling about the basic nature of the ADA language? What a shame.)

The Megamax C compiler for the ST had 8-bit shorts.
In a few years we might be seeing 64-bit longs and 32-bit shorts.

I'd like to see a new window part (ICONIFIER) added to the current
list (CLOSER, FULLER, MOVER, ...), used for iconification (or "iconization")
(or "iconifying").

Currently, I just use the "FULLER". Okay, it's confusing, but I don't
think the "FULLER" is a very useful widget anyway, and many window types
don't have any use for it (eg. any that cannot be resized).

It's time.

In my opinion, GEM bindings should either:

1. Use int for scalar parameters. Use short for everything else.

OR

2. Use short for everything, and let the casting occur on the
call to the function rather than in the function's call
to the OS.

I tend to think (2) may be better, but I'm not absolutely convinced.
I *am* convinced that we cannot continue to use int for everything.

We originally used int (even with 32-bit-int compilers) to make our
code compatible with other libraries, and hence other code written
for those libraries. But now those other libraries are changing,
so if we stick to int, the only code that will be compatible will be
that written for the old libraries.

BESIDES, you can always use a 16-bit-int compiler (-mshort) to compile
code that you can't be bothered porting to use shorts for GEM bindings.

IL> all of you who are out there writing GEM code.

Short is the way to go (for most things), IMHO. For my own sanity, I
defined a couple other formats and put them in portab.h:

/* PORTAB.H - An attempt at a more portable C */

#if !defined( __PORTAB__ )
#define __PORTAB__

typedef char 8B; /* 8 bit, signed */
typedef int 16B; /* 16 bit, signed */
typedef long 32B; /* 32 bit, signed */
typedef unsigned char 8BU; /* 8 bit, unsigned */
typedef unsigned int 16BU; /* 16 bit, unsigned */
typedef unsigned long 32BU; /* 32 bit, unsigned */
typedef float 32BF; /* 32 bit, float */
typedef double 64BF; /* 64 bit, float */
typedef long double 80BF; /* 80 bit, float */

/* Older defs, in Portab.h */
typedef void VOID;
typedef char BYTE;
typedef int WORD;
typedef int SHORT;
typedef long LONG;
typedef unsigned char UBYTE;
typedef unsigned int UWORD;
typedef unsigned long ULONG;

#endif

"MICRO"
```

Ian Lepore (ilepore@nyx.cs.du.edu) wrote:

: What you are saying, I guess, is that it is up to me to rewrite the GCC
: GEM bindings, and make them a part of GemFast as implemented for GNU C.
: This I can certainly do, although it will take a while. (I think I've
: cooked up an interim solution that will allow folks to use GemFast with
: the existing bindings as long as they use -mshort. This will let folks
: start using GemFast right away while I work over the bindings for 32-bit
: mode.)

: The real question I'm asking is: Do y'all WANT me to do this? If I
: spend time working everything over to use an interface built around the
: short datatype, it'll be a vast waste of time if everyone decides that's
: the wrong solution and they really want an interface built around the int
: datatype. (If folks decide the latter, we're gonna have to send a blitz
: of email to HiSoft and Atari lobbying for a change in the Lattice
: interface. Or, we just write off Lattice users altogether. Since I'm a
: Lattice user, I don't think much of that idea, to tell the truth. :-)

Personally I think we should use short as the type used. (i.e. use the
Lattice solution). We need to stick with the priciple of using a type to
match the OS implied data type. The fact that DRI/Atari originally used int
to be compatible (my guess) with older style C which didn't have a short
type when Alcyon C was released; should not stop us now. If you want to
compile existing code using int as the defined type I'm sure there are
perfectly good ways of hacking it as neccessary. Let's change things now
instead of later.

....
and so on.

I wonder how many more time this will have to be repeated.
It seems to me that this information also found its way into FAQ.

We see above a "classical" sample of a text written in Texinfo.
Texinfo was created with a dual purpose in life.
One - to provide a way to have nicely typeset documentation
Two - to allow for easy browsing in complicated, structured,
documents using simple character based terminals. As a side
effect this allows to print also reasonably formatted
documentation on 'fixed pitch' printers.
Both goals are supported from the same source files - with obvious
advantages.

To typeset your Texinfo documents you need TeX and texinfo.tex
set of macros (oh, and texindex program).

To format and browse your documents 'on line' you need programs
makeinfo and info (there is also a set of GNU emacs functions which
can handle - more or less - these tasks).

Atari ST port of makeinfo/info is available on atari.archive for
a looooong time. Look for archives with garbled 'texinfo' in title.
Also current version of Index should have a correct entry, I believe.
texindex.ttp is also in the same archive.

The above is totally bogus. This discussion does not affect
current gcc libraries at all. Atari DOCUMENTED various GEM parameters
to be of int type and gcc libraries follow that specification. It does
not matter if -mshort option is used or not. These libraries are written
in a manner which insulates user from internal details and always
present an interface as specified without second guessing what people
from Atari meant when they were writing 'int'.

I agree that this was not the best way to specify things, but whoever
wrote the original documentation obviously spent too much time with
MS-DOS. Well, that is life.

There is one thing I am missing in this whole discussion: what to do
with K&R C compilers which support 32 bits. I know they are not to
frequent, but i happen to have one installed (which is PD code --
if anyone is interested.) The only major problem with using this
compiler is that i am not sure that correct OS bindings exist for this
compiler! (currently using dlibs bindings for TOS).

A K&R C compiler w/ 32 bit integers cannot do funky stuff with prototypes
which ANSI compilers can. This means that short functions arguments ALWAYS
are cast -- a very time- and (program) memory inefficient process. And thus
an int seems logical overhere.

For the rest do i favour the use of GWORD -- and the use of short's, as
it will save you from problems with GRECT/PARMBLK etc.

I don't want to make a career of point out that people should
read postings more carefully before they post useless responses, but
this is getting rediculous. Jan, you've just said EXACTLY what Ian
said. It *was* the Falcon that Ian said was slow.

As for multi-tasking on systems as "slow" as 8 mhz 68000's, I've
been doing it for years (OS-9 on old Atari ST and Amiga 500). It depends
on what you're doing more than anything else. For text work it's fine.
I certainly wouldn't want to do 3D animation renders in the background
and 3D CAD modelling in the foreground though. :-)

Sounds nice, have you actually used speeds higher than 19200
succesfully, without getting garbage on the screen? Does a Falcon
really have enough power to get 153600 through the serial port?

> window scrolls twice on single-click of window control

This is a TOS bug that apparently affects all TOSes since 1.06. It still happens in TOS 4.02, so it ain't fixed yet.

There are a couple fixes available. Somebody (Charles Johnson?) wrote a DA called BUTTONFIX that mostly fixes the problem. Sometimes though, you have to open/close the DA once you've started an application to make the double-scroll problem go away. I wrote a DA called SCROLLFIX that doesn't require you do open/close the DA each time you start a new program. Both DAs take about 600-800 bytes at runtime.

To fix your own applications, I found that as long as you have done a wait for a double-click at least once in your application, the problem goes away for the duration of the application. So I started using the following little code block in the program init routine of all windowed programs:

```
XMULTI xm;

xm.mflags = MU_BUTTON | MU_TIMER;
xm.mbclicks = 2;
xm.mbmask = 1;
xm.mbstate = 1;
xm.mtcount = 50; // 50 millisec timer
evnx_multi(&xm);
```

Just doing that wait for a double-click once seems to fix everything up. Even though a double-click won't (probably) actually happen, it'll be the timer event that returns, your windows will behave for the rest of the run of your program.

This seems to be related to the graf_mkstate() bug, wherein the AES tends to 'latch' a button-down event and will repeatedly report the button as being down even when it's not, until some sort of button-related event wait call is made. But exactly how it's related, I can't say for sure.

There seems to be considerable confusion about "what Atari documented". As far as I know, all of our documentation (and DRI's documentation referring to GEM on the 68000) uses the symbolic name WORD to refer to the parameters to AES and VDI functions. Maybe very early documentation didn't, but everything I've ever seen does (and indeed, any source code that I've seen here does the same). Personally, I think that using some such symbolic constant (maybe "gem_t" or "word_t" would be more appropriate, given the ANSI name space rules) would be a good idea.

That's my opinion, anyway. "Official Atari doctrine" may be different; I'm only speaking for myself here.

>when the compiler itself has hardly changed.

Yeah well I quite like the LaserC shell. Compile/debug cycle are very
quick and the editor adequate.

For those that want a command line its there in the shell window as well.

The trouble with it was that most programs not compiled by LaserC would
not run from the shell. In particular any thing that came out of Lattice
or any of the HiSoft compilers etc. This was because they MEGAMAX did
not fill in the basepage parameters the top-of-memory pointer is always
zero. This causes other startup routines to consider that the machine has
no memory!

The only reason I don't use it much today is because I need an ANSI
compiler. Although it came in handy last Sunday when I wrote a 400
byte file over my 20K report file. Had the file back in under 10mins.

1674. FPU benchmarks

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-25 18:12:58 UTC
From: dba@jet.uk
Message-ID: <1993Mar25.181258.21094@jet.uk>
Source record: 39729

Hi netters.

I recently completed some tests on the FPU in the TT.
The interesting results are as follows:

The compiler used was LATTICE C V5.51
The first set of tests was run on an ATARI TT030 32MHz. TOS 3.06
and the programs were loaded into the 2MB ST RAM.

FFT benchmark - Double Precision - V1.0 - 05 Jan 1993

256 0.1800 7.9e-06
512 0.4000 7.9e-06
1024 0.8750 0.00
2048 1.9000 0.00

L) Compile and Link Options 68030 + Line F 68882
FFT size Time(sec) max error

256 0.0800 5.7e-14
512 0.1700 1.1e-13
1024 0.3750 1.8e-06
2048 0.8050 4.6e-06

Conclusions:
The *SAME* code can run faster by a factor of 10 on the TT, so
do software vendors *TRY* to achieve a faster result or do they
compile for the safest option (68000 + Software IEEE) and hope
that TT owners run it in TT RAM.

It would be interesting to compile the code to use the DSP
chip on the falcon to see what results are achieved.

Just trying to add some light to all the heat being generated!

dennis

> That way you have it all...

This is sorta missing the point - the hardware on certain chips really can't access small data types like 8-bit chars. For example, the TI C compiler for the TMS320C30 DSP has char = short = int = long = pointer = 32 bits. You have to do some fooling around to pack multiple chars in one 32-bit word, otherwise you get one char per 32-bits! Some RISC chips do weird things like this in order to give simple instructions and very high speed.

1676. Help! Weird Floppy Happenings

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-25 20:07:10 UTC
From: malay@sae.com
Message-ID: <1993Mar25.200710.18688@sae.com>
Source record: 39731

I have a 1040STe and an external floppy drive. I recently sold my Spectre GCR which was always connected to the STe, but ever since I sold the GCR my internal floppy drive has been doing some pretty strange things.

I had several floppies each contained one file - all the files were the same size. So I insert a disk into the internal drive and click on Drive Icon A, so far so good, the disk contents pop up - I drag the file icon to the hard disk, the file copies fine. I close the disk contents window and eject the floppy. Now the weird part, I insert a second disk, open up Drive Icon A and the disk contents show the file that was just copied from the first floppy. So I say, hmmmmm, lets see what happens in Drive B - I eject drive A and insert this disk into drive B and open the contents - looks correct, every thing is hunky dory, but I still wonder about this drive A weirdness so I insert a third disk into drive A, open the contents, the correct file name is there so I copy the file to the hard disk from drive A - I then inspected the file - the tail of the file contained data from the very first disk. I looked at this 3rd disk from Drive B - it was correct and copied correctly.

Another thing, Gemini gives "media change error" every so often from drive A.

What is going on? Do I have:

(a) a defective internal drive
(b) a virus
(c) a defective STe
(d) other

Any help or clues would be appreciated.

Bob Malay

1677. The Right Button

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-25 20:45:27 UTC
From: rm03@ic.ac.uk
Message-ID: <1993Mar25.204528.23044@cc.ic.ac.uk>
Source record: 39732

Yes, its that old problem again...
Is there any way to read the left and right mouse buttons independently
from an evnt_multi call?
What I mean is, such that evnt_multi will return if either the left *or*
right buttons are pressed. Normally, this is not possible, you can either
wait for the left, the right, or both buttons, but not all of these at the
same time.
I know there was a solution to this in an old ST World, but that uses a rather
dodgy looking assembler patch. There is also a solution in the Lattice C
documentation. I think this would not work well under MTOS, since it steals
the AES workstation handle.
I remember reading that these is a simple solution that involves passing some
undocumented value as the 'button mask' parameter to the evnt_multi call.
Unfortunatly, I cannot remember what this is or where I read it... can anyone
help? Will it work on all versions of TOS (including MTOS) ?

Thanks for any help...

>As far as I know, all of our documentation (and DRI's documentation
>referring to GEM on the 68000) uses the symbolic name WORD to refer to
>the parameters to AES and VDI functions.

Yeah, the VDI manual, when showing examples of calling the bindings in C, consitantly uses WORD as the type. However, in the section VIRTUAL DEVICE INTERFACE, pages 1-5 and 1-6, it states, "All array elements are of type INTEGER (2 bytes)." That's about the closest I can find to a definition of what the WORD type might be.

The AES manual doesn't mention datatypes at all in the example C calls, but in the chapter describing various arrays, they do use the type WORD (without defining it anywhere that I can see).

I might at this point go into a flame about how lackadasical DRI was by not defining these things, or designing a nice compiler-independent standard for the bindings. But, when I think of the fact that DRI did this work back around 1984-1985, using an 8086 processor without anything like 32-bit integers even on the horizon for that platform, I can't blame them too much. There was nothing like ANSI C back then either, prototypes were just a gleam in the eye of Bjarne Stroustrup and a few other radicals on the leading edge of language development.

Having to move code between VME cards, Suns and SGIs a lot, I always use INT8, INT16, INT32,... nowadays, with a machine-specific mdep.h defining them. It makes life a little easier.

e>preemptive multitasker. X-Windows has nothing to do with multitasking,
e>other than typically running on a multitasking system.

OS-9 isn't using any Graphics Device at default installation! If you want to use OS-9 Window or X-Windows then you've to upgrade to a faster processor else you get a very slow machine.

e>It certainly is if it can't run on a base Falcon. AmigaDOS and OS/9 can
e>run on a 68000 machine with no problems.. MultiDOS should be able to do
e>the same if it is to be considered "efficient".

OS-9 is a Realtime Multitasking Operating System therefore it has to be very fast while multitasking. But the visualisation is done using the graphical extensions named before. This does not mean that a normal 68000 system would be fast but it would run, tough.

What's wrong with using WORD/UWORD/LONG/ULONG?

These data types were *always* well-defined on the Atari:
WORD 16 bit signed
UWORD 16 bit unsigned
LONG 32 bit signed
ULONG 32 bis unsigned

As far as I know, these are the types used by GEM internally, and many GEM
docs use them in their example code (e.g. Professional GEM).

My proposal: use the above data types in all GEM data structures (GRECT,
OBJECT,...); but use int when passing parameters to functions (since a
short is expanded to int anyway when passed as a parameter).

In a message of 22 Mar 93 11:42:46, Lunnon wrote:

L> typedef short WORD;

Word size changes from machine to machine. I looked up a "formal" definition of short/int/long in my second edition K&R book (ANSI-pending version - I'll look at the 3rd edition tommorow). Simply (and non-commitial):

"The intent is that short and long should provide different lengths of integers where practical; int will normally be the natural size for a particular machine. Short is often 16 bits, long 32 bits, and int either 16 or 32 bits. Each compiler is free to choose appropriate sizes for its own hardware, subject only to the restriction that shorts and ints are at least 16 bits, longs are at least 32 bits, and short is not longer than int, which is no longer than long."

How is that for iffy? In short (no pun intended), I like the _8B, _16B, and _32B definitions in portab.h. You define what they are in the .h file for your machine and compiler, and then always use those _nB types in your code. This way, you always know what you are dealing with.

Yep, spot on I would say...

...but unfortunately there is no standard integral data type that is
guaranteed to be a fixed size, the ANSI X3J11 definition only states
minimum sizes AFAICS. Even the Old Testament states that the precision of
integral data types depends on the type of machine you're using, a
statement probably based on the fact that every unix has cc so you always
use the same compiler, the implementation being very dependent on the
hardware it runs on. eg. (from the example in the book)

DEC PDP-11 Honeywell 6000 IBM 370
char 8 9 8
int 16 36 32
short 16 36 16
long 32 36 32
float 32 36 32
double 64 72 64

I wonder why you don't see many Honeywell 6000's any more ;->

The IBM 370 also uses EBCDIC (an alleged character set) rather than ASCII.

> anyway.

The way Digital Research originally coped with this AFAICT is to use WORD as a typedef to 16 bit items and LONG as a typedef to 32 bit items. Since replacing int with short is no more or less difficult than replacing int with WORD (or GWORD, I missed the posting proposing that so I don't know the basis for the choice) why not go the route where you do get the advantage of being able to cope with a future compiler where short isn't 16 bits, you don't get any advantage from using short, it's just another iteration of an assumption for a word size where the assumption is based only on tradition and current practice rather than any standard that you can rely on (as the current discussion illustrates).

> The other thing GWORD might buy us is that if used consistantly, it

> then you won't be accessing the data in the PARMBLK correctly.)

But you _wouldn't_ define GWORD to be an int if ints were 32 bits.
The whole point of GWORD (or DR's WORD) is that it would be typedef'd so that it always was a 16 bit type. The bindings would ideally reflect the programming interface so they would accept 16 bit words and pass 16 bit words to GEM for example. Any int->short or short->int conversion is just a unnecessary distraction in compiler implementations IMHO, good bindings would prototype the bindings as requiring WORD/LONG as appropriate. In the case of Gemfast an XPARMBLK would be correctly defined as using two GRECTS if the GWORD was _correctly_ typedef'd.

That reminds me, ANSI prototypes would be very welcome in my favourite C compiler for the ST, high up the wishlist for me ;-)

> Because now you are passing pointers to shorts to a function that is
> prototyped as expecting pointers to ints.

My view of that is that the bindings would be wrong. The elements of a GRECT are 16 bit items so the problem is avoided if a GRECT is correctly defined as having 16 bit items (WORD) and the bindings are written to accept these correct structure definitions. The confusion you describe only occurs if the structures are defined incorrectly by making assumptions about int/short sizes or the bindings are defined incorrectly using similar assumptions. I believe the bindings should reflect the underlying implementation so they should do whatever they have to to make a 16 bit internal parameter be passed as a 16 bit parameter.

> It is largely because the OS itself reads and writes short values that
> are embedded within structures, and application programs have to deal
> in pointers to those items within the structures, that I feel it is
> important to have a single size-independant type used in the interface
> to GEM. This means that GWORD could not be typedef'd as int on any
> compiler where the size of an int could be other than 16 bits.

Exactly. GWORD would be typedef'd as (probably) short on a compiler where an int wasn't 16 bits. Another popular convention is to use the typedefs INT16 and INT32 respectively to avoid any ambiguity in the meaning. Obviously it would then be ridiculous for an INT16 to be typedef'd as an int where that was actually 32 bits wide. The whole point of these indirect typedef's is that they always represent a fixed word size by using an appropriate standard data type, they don't vary their word size by using the same data type, regardless of implementation.

BTW, I don't suffer this problem at all at work even though I prototype on a PC using a 32 bit int for a target DSP based embedded system with a 16 bit int. I've used int if I don't care about any specific word size, WORD if I need 16 bits (I often do to access ports, interact with assembler) and LONG if I need 32 bits. It all works fine. The compat.h header I use has conditional compilation to provide the appropriate size for each environment.

My vote has to go for an indirect typedef, whether it's WORD, GWORD or INT16 for a 16 bit size is relatively unimportant, DR use WORD, INT16 is wonderfully explicit. The choice between int and short can never be correct, C is my favourite language but it intentionally makes no attempt to provide standard integral data types of any particular size. The only hope is that there always will be sensible sized standard integral values which can be used via a typedef.

If you do decide to choose between int and short (bad idea IMHO) int is already incorrect if it is 32 bits because the GEM data structures often use 16 bit words, bindings that hide this to cope with a poor implementation are just solving the wrong problem. Since some compilers already use 32 bit ints they have to use short for now but it isn't correct either, it just delays the correct decision for another few years.

Oh, if I haven't said so already, thank you very much for HSC, I searched high and low before I tracked 1.33i down in the UK. I obtained Usenet access just so I could monitor your postings and I'm now a happy 1.40 user. I really don't think I need warning that static void functions don't return a value though ;-)

Cheers, Steve.

From: wmtwen@rw8.urc.tue.nl
Message-ID: <wmtwen.733140898@rw8.urc.tue.nl>
Source record: 39655

My opinion on the short vs int debacle:

use short. At least that way I am sure that short = 16 bit and int is
something possibly larger.
And another reason that I would like to see short used (so does this
mean that we will get prototyping in HSC sometime?) is that the Hisoft C
interpreter is on this months Atari ST User coverdisk. It seems to me
that this is the ideal tool to use with HSC. First test-run debug etc.
using the interpreter and then when I am satisfied with the program,
create a stand-alone program with HSC.

Could someone please suggest me a simple method to detect whether or not a mono monitor is attached to the ST(M,FM,E) ? I'll be using Sozobon (H&S) C.

Many thanks in advance.

- Rahin (rahin@scs.leeds.ac.uk)

The alternative would be to use gemstart or whatever instead of a getty on the console. This would mean that on the console you would be running GEM and the desktop as root, the other getty's would be totally unaffected so people could log in via the serial ports. You then just have to have TOSWIN running as a desk accessory.

Note: I've not tried this myself, though in theory it should work.

You'd better make sure you also updated the utmp and wtmp files as well! :-)
And how do you change the user ownership of GEM? If GEM is running as root (pid
0, group 0) how are you going to stop people accessing all the files whoever owns
them?

|> Mark Lehmann Senior Texas A&M University
|> lehmann@cs.tamu.edu

What you need to do is to have a program which does the same sort of thing as xdm
for X-Windows, ie it starts the server (the VDI and AES) then puts a login window
on the screen. When someone logs in on this you can then run the desktop, if the
user so desires, you could run any other GEM program if you wanted. The VDI and
AES aren't processes as such, so there would be no problems with access
priviledge, though I haven't a clue what would happen with desk accessories, as
they are pseudoprocesses.

When the GEM runtime process (the program run) finishes, the login daemon would
log out the person and put the login window up.

Simple, but is it possible with GEM?

1703. PC Hard Drive controller for 1040Ste?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-26 12:26:02 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Mar26.122602.4872@dct.ac.uk>
Source record: 39657

Hi! I posted this to the other newsgroup as well, just to get this spread around!

Does anyone know of a U.K address that I could get one of those controller thingys for using PC Hard Drives?

How much do they cost?

Thanks for any help given,

Feekzoid

1704. Re: Falcon & MultiTOS speed

In article <and.12.0@thor.mim.uni-hannover.de>, Andreas Kromke
(and@thor.mim.uni-hannover.de) wrote:
>Nobody ever used MultiTOS, except a few developers with 16 MB 32MHz TTs.

Wrong. I use MultiTOS (right now) and I 'only' have 8 MB.

You are right that even a TT is too slow to do serious background jobs
(especially when they require a lot of disk I/O). But as long as you
only run *some* GEM applications (all idle as long as they don't get
input), MultiTOS works fine even on a MegaSTE.

Finally, when complaining about MultiTOS, you should *also* tell the people
that you are one of the authors of a competiting product (Mag!X, which is
indeed very fast, but which doesn't have MiNT's similarity to Unix,
which a lot of people like).

1705. Atari DOS to MS DOS file conversion

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-26 15:08:42 UTC
From: edjac@tweety.lerc.nasa.gov
Message-ID: <1993Mar26.150842.27105@eagle.lerc.nasa.gov>
Source record: 39660

I've got a neighbor that has a whole library of old ATARI games that he'd like to run on his 286 machine. These run under the ancient and now defunct ATARI DOS 3.0 O/S, 8-bit graphics (I think). I told him that I had never heard of a file conversion utility for ATARI DOS to MS DOS, but assured him that I'd post and see if anyone out in netland may know of such a utility.

Thanks.

1706. 2nd CFV and VOTE ACK: comp.sys.atari.advocacy

Newsgroup: comp.sys.atari.st.tech

```
SECOND CALL FOR VOTES and MASS VOTE ACKNOWLEDGE
===============================================

This vote has been running for two weeks.

This is a Call for votes on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Charter
=======
This group is a forum for discussion of topics in connection with the Atari
range of computers - marketing, capabilities, comparisons and other
arguments... It will move discussions of this nature from the existing
comp.sys.atari.st (and atari.8-bit) newsgroups, which will exist for a more
advice orientated discussions.

Users will be requested to not post the above discussions in the existing
newsgroups if advocacy is formed.

Users will be requested not to cross post disscussions in other advocacy groups
to this one.

Rationale
=========
This group will separate a section of discussion, mainly from the current
newsgroup comp.sys.atari.st but also relatted topics including the Atari 8-bit
range of computers (atari.8bit) and the new Atari Falcon computers.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST/8-bit computers
can continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

Voting
======
VOTING PERIOD IS:
```

appearance of this message
to 1st April at 9:00 GMT.

HOW TO VOTE:
1. REPLY to THIS message.

2. send your votes to:

dxo@cs.bham.ac.uk

3. if that doesn't work, try:

dxo%cs.bham.ac.uk@nsf.ac.uk

WHAT YOUR MAIL MESSAGE SHOULD CONTAIN:

For a yes vote:

I vote "Yes" for the creation of "comp.sys.atari.advocacy"
VOTE: lastname, firstname [email address] : YES

For a no vote:

I vote "No" for the creation of "comp.sys.atari.advocacy"
VOTE: lastname, firstname [email address] : NO

Your message must be of THIS form, especially the second line since
my vote counting software needs bothe the 'VOTE:' and the ': YES/NO'.
Remember to replace the lastname forename and email address with YOUR
name etc!!!

Rules on voting
==========

Voting Rules:
-Only one vote per user (Two different people cannot vote under the
same user name).
-Any votes which are received before or after the voting period
will be discarded.
-Any vote which does follow the above examples specifically,
will not be valid.
-Anyone who wants to change their previous vote may do so by voting
again. They must indicate that they have previously voted and are
changing their mind in a footnote. A changed vote will discard your
previous vote.

Ambiguous Votes:
Ambiguous votes -- those who do not follow the specified format, or
do not make clear the voter's intent, will, where possible, be
returned to their senders for clarification. Ambiguous votes which
cannot be returned to their senders or for which no clarification is
provided will be identified in vote mass acknowledgements and in the
final vote tally.

******* ANY PROBLEMS, MAIL THE ADDRESSES ABOVE! *********

Thanks to Danny Richman for the basis of this CFV!!!!!

Proposers
=========
David Oakley dxo@cs.bham.ac.uk

I don't think what your friend wants is possible (read on for exception).
You can COPY files from an Atari 8-bit system to a DOS-based system
(using a null modem, or ATARIO if the disk format is handled).

However, you cannot (to my knowledge) simply covert an executable
file of one system to an executable file for use on another type
of system. DOS-based systems and Atari 8-bits are totally different
entities, internally and externally. It would be like trying to
play a cassette tape on a CD-player - things aren't compatible.

The *only* way that he could run Atari 8-bit stuff on a DOS-system
is *if* there is an Atari 8-bit emulator for the IBM (Darek?). If not,
then ya'd probably need an 8-bit system to run the games (check out
comp.sys.atari.8bit I think). Even if an emulator existed, to handle
most games it would have to be *very* complete...

I believe that there is a package called GalaxyCAD on a.a.u.e, although I
have not seen it. There are docs there as well, a text file that you can
read. From the description it seems like a rather nice system, though...
And yes, despite the name, it IS a digital circuit designer...

1709. Re: Detecting MONO monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-26 18:08:13 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Mar26.180813.17662@mnemosyne.cs.du.edu>
Source record: 39663

```
>Could someone please suggest me a simple method to detect whether or not a
>mono monitor is attached to the ST(M,FM,E) ? I'll be using Sozobon (H&S) C.

If you're using HSC v1.40 (that has GemFast v1.8 in it), the easiest way
to check whether you're running in monochrome would probably be:

appl_init();
apl_vshared();
if (gl_vwout[13] == 2)
is_monochrome = TRUE;

If you actually need a VDI workstation open for yourself, use apl_vopen()
instead of apl_vshared(), and save the handle for your own use.

1710. RCS 5.6 for mint

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-26 18:55:34 UTC
From: krinke@ips.cs.tu-bs.de
Message-ID: <1993Mar26.195535@ips.cs.tu-bs.de>
Source record: 39664

Hi!

I asked that before, but nobody answered:

Has anybody successfully ported rcs 5.6 under mint? The config.h, which was
in the updates for the TOS-Gnustuff, work neither with the mintlibs, nor with
mint itself.

To *anyone* interested in overscan....

The Overscan available on atari.archive.umich.edu (and elsewhere, including commercially), will NOT work on any machines above the STFM!
(Or Mega-ST).

It will not (apparently) work on TOS versions newer, or older, than 1.2 (1.02), or 1.4 (1.04).

If you have an STE, Mega-STE, TT, Falcon, you can forget about this overscan. (The Falcon has overscan, so you don't really need it anyway).

I know I shouldn't post this on Friday afternoon, but I like getting mail
on Monday....

It's hard to reach me. Try phoning and try the alternate addresses in
the .signature.

EXTERNAL 80 MB DRIVES:

$260 -- This was a 30 Mb LaCie with a dead drive. I upgraded to an 80 Mb
Maxtor 7080SC. It's currently formatted and tested on a Mac II.
Two Apple SCSI connectors, fan and power switch. Currently configured
as SCSI address 4 and has internal termination.

$260 -- This is a POWERdrive chassis. I took out the Seagate ST296N and put
in another Maxtor 708SC before I discovered the power supply was the
culprit, so that's been replaced too. Two Centronics SCSI connectors,
fan, external SCSI address switch. It's not a LaCie, but it has a
an address switch! Formatted and tested on a Mac II.

I have drive documentation, but nothing for the boxes.

INTERNAL SCSI DRIVES:

$160 -- Maxtor 7080SC (still a few bare drives left!). 3.5 inch, 1 inch high,
18 mS, 32K on board cache, SCSI drives. Used, but not abused (good
condition). Have sold these to Amiga and IBM users and used them
myself in a Mac.

$120 OBO Seagate ST296N. 80 Mb 5 1/4 inch HH SCSI drive. Came out of what
was thought to be a dead POWERdrive chassis. With new power supply
in it there's no room for a 5 1/4 inch drive. Been formatted and run
on a Sparc Clone, but it's too small for UNIX.

INTERNAL OTHER DRIVES:

$100 OBO Micropolis 1325. 68 Mb MFM, 105 Mb RLL 5 1/4 inch Full Height drive.
Currently in use in my 286. For $25 more I'll throw in a full length
RLL controller with it. I've been using it for about a year and a
half, but mfg date is ~1986. Built like a tank. Works great.

$100 -- Maxtor 7040AT 3.5 inch 40 Mb IDE drive. Same specs as the 80 Mb
7080SC, but it's IDE and 40 Mb.

ODD THINGS:

$25 -- I still have a few Archive 5945L-2 60 Mb tape drives. These take DC-300 and DC-600 cartridges (I'll throw one in. They're the size of a small paperback). A while ago I thought these were SCSI, but I was mistaken, they're QIC-02. They act alive when you put a tape in them but I haven't time to disassemble my other drive to test them. Buy them as-is for $25. I can give you the name of a fellow on the net who has QIC-02 interface boards. THESE ARE INTERNAL, BARE DRIVES.

1718. Higher Resolutions on Falcon Now Possible?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-27 01:15:12 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1993Mar27.011512.23908@news.arc.nasa.gov>
Source record: 39672

Several posts have mentioned the ability to generate higher resolutions just in software (e.g. 800x768 or 800x600). Is there any way or place to access this software? This sure would make the Falcon more attractive to me. Can the "super_78" program (sets SVGA screen to 78Hz scan rate) be used for changing resolutions?

Thanks.

- Glenn

1719. Falcon As MIDI Sampler?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-27 01:22:19 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1993Mar27.012219.24191@news.arc.nasa.gov>
Source record: 39673

Is there any way at present to use the Falcon as one would a traditional sampler in a MIDI context? I know you can sample sounds and save to disk, but what about playing notes on the Falcon using MIDI note-on commands? Right now, I'm not as interested in triggering an entire audio track as having the Falcon respond to MIDI commands, like note-on, velocity, and ideally other MIDI continuous controllers like volume, etc. Is there any software present or planned, that will allow the Falcon to be used in this manner?

Also, when playing back the digital audio tracks, the only way to get the audio from it (without some expensive hardware addon unit?) is through its builtin stereo out port, correct? I've read that since this is "bass-boosted", its not suitable for "pro" recording applications. Is this really an issue? Couldn't it be treated with outboard EQ if it were too boomy?

Thanks for any illumination.

- Glenn

1720. Readline library

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-27 01:53:03 UTC
From: BGBC <BGBC@MUSICB.MCGILL.CA>
Message-ID: <26MAR93.22554942.0062@VM1.MCGILL.CA>
Source record: 39674

Hi,

I've been trying to get the Readline library to work, and so far I had no success. I tried the version at a.a and also the original sources (older) of Readline 1.1 posted at the gnu archives. It seems to work fine (didn't check key bindings yet) for command line editing and for file name completion, but as soon as I use my own function for command completion it blows up with address error. Similar behaviour can be observed with the fileman program supplied with it in the example directory. I have a feeling that I'm missing something obvious here.

I would appreciate any coments from someone who succeeded in porting this library to ST&MiNT. Please post here, or to save bandwidth mail me at petet@emf.lan.mcgill.ca

Thanks,
Pete. (posted by a friend)

A while back Claus Brod posted the following answer to this question...

R. Tim Coslet

Usenet: R_Tim_Coslet@cup.portal.com
technology, n. domesticated natural phenomena

----------cut here----------
dcrevier@jarthur.Claremont.EDU (Dan Crevier) writes:

>I remember a while ago people were discussing how to get an event from the
>right button _or_ the left button. I wasn't paying attention then, but now
>I have found I want to do that, and I can only seem to read events from both
>buttons pressed together. I think I remember the solution being simple.
>Could someone post the solution?

One method - undocumented though, but valid for all TOS/GEM versions -
is to add 256 to the number of clicks waited for. This negates the condition
for a return from evnt_multi due to clicks. Example:

```
mstate = 0
mclicks = 256+2
mbuttons = 3
```

This means: Wait for 'NOT both buttons released' = 'One button clicked'.

I know this is undocumented stuff but _very_ useful. And I would love it
if Mr Pratt or someone else at ATARI could promise us that this feature
will stay. PLEASE Mr Pratt - do us a favour. The only other way I know

of something like selective mouse click waiting can be done is linking into the mouse vectors and - whenever the right button is clicked - pretending that it is indeed the left one. But this causes much trouble everywhere, and it is not even completely legal - after all, you have to use those VDI mouse movement vector exchange routines that are reserved for AES use only.

>
>What is going on? Do I have:

How were these floppies formatted? Exactly this kind of symptoms can occur
if the floppies all contain the same "serial number" in their boot sector!

This confuses Atari's media change detect code and it reuses the directory
and FAT of the old floppy instead of loading new ones. This can SERIOUSLY
corrupt floppies if you write to them when this has occured.

If you know you have a few floppies that happen to have identical "serial
numbers" (e.g. floppies formatted on a PC), always place a different disk
in that drive and access it before putting in the floppie you really want.
Although a better solution would be to reformat them or fix their "serial
numbers".

Another possibility is that your A drive's write protect sensor might
have failed (this is what Atari checks to see if media might have changed
before examining the "serial number" to confirm if it really changed).

Check to see if your machine will let you write to write protected floppies.

>C's source level debugger on the Macintosh.

True, THINK's debugger can't toggle you into assembly view. But you
can always generate assembly listings with a menu selection, and you
can always disassemble with a low-level debugger, which is more appropriate
for the job anyway. *And* if you write inline 68000, THINK C will single-
step it for you. If you really need to toggle an assembly view, use SADE
or Jasik.

What am I doing reading this group? I must be on drugs.

Too much inertia from the immense weight of C means that C++ will be flogged for another few years until the masses figure out it isn't the Next Big Thing and causes more problems than it solves.

Of course, the lack of affordable Eiffel implementations has a fair amount to do with it. I would just about kill for a MacEiffel. Well, I guess I *would* kill for one, if it were the right victim.

Yup, I've used it a little...

m> Does it use extra hardware or the MIDI/RS232 ports? What's the
m> performance like?

Depending on your hardware you can talk via MIDI (extra hardware) cart port (extra hardware) or via the LAN port (if you have one, alse req. extra hardware)

I've only used it via the LAN port, with a simple RS422 null cable. Performance was okay, with some significant drawbacks.

You have to run Powerdos - a rather bogus multitasking TOS substitute - for Powernet to work. If you're not expecting to do much on your system, Powerdos may work ok for you. You can't (yet) use powernet under MTos.

i> about.

I can't see any real reason for all this debate : As you've clearly stated, the AES/VDI use and expect 16 bit values. Not ints. Thus, the interface to the AES/DVI should use some 16 bit data type. Conversion/translation operations are a major waste of time and space, and should not be considered as a viable option under any circumstances.

The only 16 bit type which is currently common is the 'short' type. It _may_ be worth defining an INT16 type, if people want to jump up and down about naming, and the potential abiguity of the 'short' type, however that's just another implementation detail.

1729. A couple of Falcon questions..

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-27 20:48:45 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Mar27.204845.22577@prime.mdata.fi>
Source record: 39684

I was wondering, what kind of monitors does the Falcon _directly_ accept, that is without any adaptor? I heard that it needs somekind of adaptor for some sort of monitors.

I was also wondering, how does one change to TV/monitor resolutions on a Multisync (I understand that with Multisync one can display both TV and VGA resolutions?). Is it possible to use the interlaced/overscanned resolutions on a Multisync?

I saw a disk-loaded version of TOS 4.02, and it had also the TT resolutions in the "Compatibility modes" section, how is the Falcon going to display the TT-High mode? (I mean, doesn't it have a max. resolution of 768x480?).

What about the Falcon's ROM-cartidge port? I heard it is different from the ST one, this would imply that eg. MIDI software that use the cartidge port for keys don't work, because their key doesn't fit? In this case, are there going to be adaptors? What about the ASCI adaptors that let you use Megafiles and SLM Laser printers, are they on their way?

Is there anybody that knows about the Falcon's architecture well enough to tell me how the bus is connected to which devices? Does it look anything like this :

```
VIDEL
|| (Double lines = 32-bit)
CPU----COMBEL====RAM
```

I'd also like to know how the DSP connects to the other parts of the system.

Is there anything that would prevent/make it difficult to use the DSP for fast 3D-vector graphics, like in flight simulators?

Thanks to anybody who bothered answering even some of these!

>I was wondering, what kind of monitors does the Falcon _directly_
>accept, that is without any adaptor? I heard that it needs somekind of
>adaptor for some sort of monitors.

I guess that depends on what you mean by direct and adapter. The Falcon video port is a DB19 socket, which isn't compatible with anything I've ever heard of. My Falcon came (from Atari) with two adapters: one is DB19 to DIN10, for use with an SC1224. The other is DB19 to DB15, for use with VGA. Neither is an active device, both of them just look sort of like gender changer plugs, to use the closest analogy.

There's also an RCA-style plug for TV output, but I've never gotten it to work. I'm not sure if it's RF output or composite output, but I've tried plugging it into the TV (via a video game switcher), and into the Video In on a VCR, and I didn't get a picture either way.

>I was also wondering, how does one change to TV/monitor resolutions on
>a Multisync (I understand that with Multisync one can display both TV
>and VGA resolutions?). Is it possible to use the interlaced/overscanned
>resolutions on a Multisync?

The Falcon seems to work in all video modes with a multisync monitor hooked up, except for overscan modes. (I don't know if it's impossible to set overscan modes, the desktop video dialog doesn't offer any overscan options, and I've never tried it programmatically.)

You can't run 640x480x16bit noninterlaced on a VGA, because it would take so much bus bandwidth that the CPU wouldn't get anything done. (This, IMO, makes a strong argument for a fixed screen location and dual-ported RAM.)

On my TOS 4.02 system, the Compatibility Modes dialog lists only ST Low, ST Medium, and ST high. Nothing about TT modes at all.

>Is there anything that would prevent/make it difficult to use the DSP
>for fast 3D-vector graphics, like in flight simulators?

I haven't looked at the DSP docs for a while, but I seem to remember that the DSP can do DMA to/from RAM, including screen RAM I assume, so there shouldn't be any trouble with using it as a graphics coprocessor. Ummm, except you might have to be careful about cache coherency if you've got both the DSP and the CPU reading/writing the screen. (That's true of the blitter chip too, if you program the chip directly instead of going through OS routines that use it.)

Source record: 39686

Has anyone here ever used the v_cellarray() or vq_cellarray() VDI functions?

Whenever I look at the docs on those functions, I'm left with the vague impression that they're probably very useful, if only one could figure out just what they do.

I think that the standalone version of readline is out of date. Try the readline library that comes with bash. Probably you can compile it without changes, if not, get bash 1.10 for mint from a.a.u.e

>the same if it is to be considered "efficient".

The kernel of MultiTOS is fine, it is efficient. The problem is that GEM's VDI and AES both run atomically and halt the OS whilst they do their stuff (as far as I am aware). There is also a problem with disk access, the hard disk driver lives below the kernel and was designed with a monotasking machine in mind, ie it blocks! So every hard disk access halts the whole OS. In my opinion this is the next thing for Atari/Eric Smith to fix.
Eric/Atari, get a non-blocking version of AHDI (or better still generic SCSI/ASCI device driver) into the kernel and make it non-blocking!

There's also the problem of allowing user-level processes to go into supervisor mode, so stopping themselves being pre-empted. Maybe MiNT should

emulate Supervisor mode for such processes so they can't take over the
system.

>
>>But you just shouldn't expect of it what simply can not be done. The Falcon
>>is a wonderful machine, but multitasking on it probably asks a bit too much
>>of the system.

It isn't planned, it's here :-)

I saw the latest version of 'Steinberg Cubase Audio' at the CeBit.

It's a 'normal' Midi program, a harddisk recording program and a Midi
sampler in one and in parallel! It is really unbelievable.

It seems the highest speed that the ST computer supports is 19200bps.
This means I can't set the serial port at a higher rate so my
throughput is greater than 19200bps when using data compression and
a 14.4 modem.

Also, does anyone know of a telecom program that will allow you
to have a fixed serial port rate, meaning that I can set the
serial port at a different speed than what I'm connected to.
Again, this would increase my throughput at a lower speed (say,
2400bps) if the other side supports it.

I'm currently running on a 1040ST and Flash.

I was wondering, what kind of monitors does the Falcon _directly_ accept, that is without any adaptor? I heard that it needs somekind of adaptor for some sort of monitors.

Well, that depends on what you gather as _directly_. The connector on the back is nothing like a VGA-connector, allthough it supports all the signals needed. What the different adaptors DO, is just convert from one kind of connector to another. All the signals are available on the Falcon to support VIDEO, RGB (SC1224), Digital (SM124), and VGA monitors. The only thing one has to do is select what kind of monitor one wants. This is done with 2 signals which has to be pulled low/high according to what kind of monitor you have connected. (Two bit version of "Monochrome detect" one might say -> gives 4 possibilities).

I was also wondering, how does one change to TV/monitor resolutions on a Multisync (I understand that with Multisync one can display both TV and VGA resolutions?).

You change signals on the two-bit selector.

I saw a disk-loaded version of TOS 4.02, and it had also the TT resolutions in the "Compatibility modes" section, how is the Falcon going to display the TT-High mode? (I mean, doesn't it have a max. resolution of 768x480?).

It doesn't. It only supports the colour resolutions of the TT.

What about the Falcon's ROM-cartidge port? I heard it is different from the ST one, this would imply that eg. MIDI software that use the cartidge port for keys don't work, because their key doesn't fit? In this case, are there going to be adaptors? What about the ASCI adaptors that let you use Megafiles and SLM Laser printers, are they on their way?

The cartridge-port looks identical, but I don't know. I guess the keys will fit. People have allready confirmed that the new version of Cubase work on both TT and Falcon so I guess the port is infact identical.

Is there anything that would prevent/make it difficult to use the DSP for fast 3D-vector graphics, like in flight simulators?

A maximum of 1 megabyte/sec transfer from DSP - CPU/main-memory should be sufficient (?).

Maybe I misunderstood something, but I get the impression you are saying that the Falcon can't be directly connected to a VGA or SC1224 monitor? That means that to connect the Falcon to any of these display devices will mean that you have to use an adaptor? Strange if it is like that. How does the Multisync connect?

>>I was also wondering, how does one change to TV/monitor resolutions on
>>a Multisync (I understand that with Multisync one can display both TV

>options, and I've never tried it programmatically.)

How do you tell the Falcon to use the TV resolutions? I didn't see any options in the graphics settings that would let you change to TV resolutions, there was 80/40 columns and 2-256 colors, and the compatibility modes. From this I assumed that the Falcon automatically identifies the display device it is connected to and uses the corresponding resolutions. But if you have a Multisync that is capable of both TV- and VGA modes, how do you specify which ones to use? Also, I don't remember a way to specify the vertical resolution, but I could be wrong, so are there some options to select the line doubling modes on VGA (or the ???*200 resolutions on TV/ordinary monitor)?

About overscan, I think that it was mentioned in the official-looking screenmodes-sheet by John Towsend (?), that overscan isn't selectable via desktop, but has to be manipulated by programming.

> You can't run 640x480x16bit noninterlaced on a VGA, because it would take
>so much bus bandwidth that the CPU wouldn't get anything done. (This,
>IMO, makes a strong argument for a fixed screen location and dual-ported RAM.)

I think I was thinking of something in that direction too, I thought
that separate screen RAM + a separate bus to it would have been a nice
thing. I don't know what dual-ported RAM is, but maybe it is something
similar?

> On my TOS 4.02 system, the Compatibility Modes dialog lists only ST Low,
>ST Medium, and ST high. Nothing about TT modes at all.

The guy that showed me his Falcon said that in 4.02 there would be
compatibility modes for the TT, and I think he even loaded TOS 4.02
from disk (he had 4.01 on ROM's), and showed the TT modes there,
TT-High was however shaded (unselectable). TOS 4.02 was the label on
the disk at least..

About TOS 4.0x, anybody who knows about it is welcome to tell me about
it, how dows it differ from older TOS versions etc. I already know
that it has a 3D-look to it, and that the new Falcon resolutions are
supported, but I'd like to know things like whether the icons can be
edited or not, if the famous RTS/CTS bug is fixed, is AES/VDI
completely recoded or just added to, etc. etc.

> to consistently reproduce this one.

Try adding one line to the function tos_dskchng() in TOSFS.C:

```
New> if ( (ti->attr & FA_DIR)==0 ) /* NOT a subdirectory */
while ( (f = nextf) != 0 ) {
nextf = f->next;
f->next = 0;
}
ti->open = 0;
/* if there are any cookies pointing at this name, they're not
* valid any more, so we will *want* to get an error if they're
* used.
*/
```

and the problem should go away; without this fix, tos_dskchng() occasionally
(depending on TOS and Desktop versions) overwrites system vectors.

Gemini is a VERY big desktop replacement, not much use on a 1meg system!
Although it has plenty of features!
DC-Desktop is a bit lacking on features compared to Gemini, but is a
lot smaller!

The best I've seen is 'Teradesk', as many, if not more features than
Gemini, all-loaded, uses only 120K of RAM, and roughly the same amount
of disk-space!

Great program, which uses TOS 2.xx and higher DESKTOP.RSC files for the
icons, so you can swipe those (it comes with the basics).

DC-Desktop should be in the /Dc section on a.a. (If it's PD that is,
I can't remember, the version I had was probably the demo)
The latest (last) version of Gemini is available somewhere on
atari.archive.umich.edu (probably in the Utilities/Desktop section)
Teradesk should be on there as well, if not, I'm sure someone else
knows where it is!

1745. GRI Genlocks for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-29 03:28:15 UTC
From: phiscock@ee.ryerson.ca
Message-ID: <1993Mar29.032815.2485@ee.ryerson.ca>
Source record: 39548

I have two GRI Genlock units for the Mega that I originally acquired for a job, but never used. Originally about $800, I'll sell them for $100 each. They've never been out of their packaging.

If interested, please contact me by EMAIL since I don't read this sig regularly.

(For the non specialist: a 'genlock' allows an NTSC video signal to be superimposed on the Atari colour display, and the resulting combo recorded to some other destination. Useful for video overlays.)

Thanks for the net time.

EXPLETIVE!

I don't even HAVE the 16-bit-int library in my standard GCC library area.
16-bit ints are OLD and USELESS. Especially for TT and Falcon users (I'm
not either).

If anyone tries to make ME use 16-bit, I just won't use their library.

And Ian understands this sentiment. Libraries CAN be written to maximise
the compatibility. Forcing library users to use 16-bit ints, will simply
lose library users.

Yes the Atari LAN port is _HARDWARE_ compatible with Appletalk BUT I have yet
to see or hear about any software compatibility. Does PowerNET work with an
Appletalk network? Having seen TOPS from Sun working on Macs and PC's I think
support for that too would be a boon.

In <A14405@K.maus.de>, Robert Federle writes:
>OS-9 is a Realtime Multitasking Operating System therefore it has to be very
>fast while multitasking. But the visualisation is done using the graphical
>extensions named before. This does not mean that a normal 68000 system would be
>fast but it would run, tough.

demonstrated here is the classic misconception about real time
operating systems. A "real time" os does not have to run fast. it just
has to run *predictably*. a RTOS will include in its specification how
long it takes to do various things like interupt latency, scheduler
overhead and different os calls.

Once you have this information, you can design a real time system (i.e.
a system where getting an answer late is the same as getting an
answer wrong).

I usually sum up the difference between fast and real-time as "quick as
a bunny" vrs "predictable".

If you look at os-9 using the above definition of a RTOS, you will find
out that os-9 isn't a fully documented RTOS because it is missing
its execution time specification.

That could become a lot better once we have interrupt-driven disk drivers.
If I could only find some time for that ...

> only run *some* GEM applications (all idle as long as they don't get
> input), MultiTOS works fine even on a MegaSTE.

But not on a standard Mega. MiNT & MTOS are great, but now that the
base functionality is there, some effort should be invested in
speeding it up.

> (Mag!X, which is
> *indeed* very fast, but which doesn't have MiNT's similarity to Unix,

Just to note - I think you can set Gemini to "overlay" mode, whereby
it "unloads" itself when you run a program, and then re-loads itself
once that program is complete. This would probably allow you to run
it on a system with smaller amounts of RAM. Of course, you'd probably
need a hard disk to make this method worthwhile. How this would
work under something like MultiTOS, I don't know, but then again
if you only have a 1 meg system, then MultiTOS probably won't be
a good idea to use anyways :-)

>user action etc...).

You have to be damn sure that a change in scheduling policy is going
to produce the effect you require before you bung it in an OS release.

The technique generally used (certainly in Unix-style schedulers) is to
prioritise I/O-bound processes over CPU-bound processes.

This makes for good interactive response because I/O bound processes are
generally those that are interactive. They get most of the CPU time and
soon become CPU-bound, so their priority falls.

My general point is that scheduling theory is more complicated and subtle
than you might imagine.

Sounds nice, but probably not tool practical. I'm still waiting for ASV
(Atari System V, rel.4) for my TT. It's still in Developer only version
and extremely expensive. Since Atari boldly advertised ASV with the
TT, one would think that at least some form of Unix would be available
by now for crying out loud. Well, maybe when the 68040 machines are
out, it will happen (yeah right?). Speaking of such, are the 68040
machines showing at Cebit???

hello !

i also got a problem with the sound-systsem of the falcon :
if i use the dma-sampling mode 16bit stereo for direct-to-harddisk-
sampling there are click (or crack)-noises when replaying the sample
from HD on _one_ channel (of the stereo). this does only happen, when
using sampling-rates 33880Hz and 24585Hz... the samples are error-free,
when playing them with 49170Hz for instance, so they are *recorded*
correctly ! is anybody having the same problem ?
Also i didn't manage to use sampling modes 8Bit mono or 8Bit stereo
when using respective parameters, the recorded samples can only be
played with 16 bit stereo mode .. seems as independend of parameters
for setsndmode() there always is used the 16 bit stereo mode ...

Franky .

Go with GEMINI. DC-Desktop is feature-starved, as is Teradesk (differing opinions not-with-standing).

I run it on a 1MB machine with no problems (recommend that you have a hard drive). There are several options you have when launching a program - GEMINI uses a small program called runner that basically saves the context of GEMINI when running programs, thus saving you a lot of memory taken up by GEMINI. It comes with a good, Unix-like console window, scripting capabilities, and hooks for external programs. I like it. Your mileage may vary.

The deskjet RAM cartridge can't be used as a print buffer (at least all
models up to a DJ 500, don't know about 500C / 550C), and the soft font
format is different to the HP Laserjet, so only very few programs support
soft fonts on the DJ.

KS>It is not clear to me why the bindings can translate GRECT's, but cannot
KS>translate ICONBLK. By doing something like that you really create problems!

One example where you can't convert ICONBLKs in your bindings: create a
ressource file and load it via rsrc_load(), then you get 16-bit-ints in
the ICONBLK structures. Everything works fine, eg using objc_draw() or
form_do(), since the AES expects 16-bit ints. Now think you get the
address of the tree via rsrc_gaddr, calculate the pointer to some object
and follow the pointer to the ICONBLK. You can't convert anything when
accessing this ICONBLK since there is no library call involved.
example:

```
OBJECT *tree;
int x;

rsrc_gaddr(R_TREE,TESTTREE,&tree);
x = (ICONBLK *)(tree[ICON1].ob_spec)->ib_xchar;
```

(That's how it *should* work, I have only done this in PureC until now,
but it's only to demonstrate the problem, OK?)

Source record: 39573

I've got an old atari 520 ST (upgraded to 4 meg) and recently, the disk drive will no longer read disks from the desktop. Booting up the ST will provide the usual desktop with the A and B incons trash etc. The drive is accessed like it's supposed to be during bootup, but the drive will always stay at track 00 (Indus GT drive). The drive works fine on other setups.

Directories and such will not be read when the A/B icon is double clicked. Demos however, will load up (provided that the boot sector tells it to, I assume) and tracks will be located etc and everything works fine.

Could this be a ROM problem? Traces to the ROM ... ? anything?

Help....

IL>Lattice user, I don't think much of that idea, to tell the truth. :-)

I don't think you should change anything in your code, since the short
approach is a very natural way to access GEM - if the GCC library does
something different (and using int there *is* ineffective, and I hate
that!), then it needs to be fixed - not necessarily by you.

TurboC / PureC is no real problem, since both only support 16-bit ints,
so you could easily exchange the 'int' with 'short' in the include files
and everything will still work.

That's because there is a *bug* in 2.06 which doubles the seek rate, so
if you set 3ms, you get 6ms.

WABE> As for "no damage resulting from repeated disk access" despite
WABE>this groaning agony sound - well, I take that with a big pinch of salt and
WABE>am reminded of Mandy Rice-Davies ("He would say that wouldn't he?"). Disk
WABE>drives ARE mechanical devices and there is no mistaking the sound made by
WABE>an "overstrained" mechanical component.

It's not overstrained, it's just operated at half speed, and
unfortunately you get closer to the resonance frequency that way, which
makes it louder. This also explains why it is different with some types
of STs, since the drives vary.

WABE> I, for one, will probably change back to my original TOS 1.60 chips
WABE>(despite its bugs & limitations) in the near future.

Don't do that, especially when using a harddisk. TOS 2.06 has some
important bugs removed, and it really does no harm to your floppy disk
drive.

Source record: 39577

I've been fiddling around with GEM recently and noticed something that many GEM programs do that I can't seem to find any reference to.

When a window is re-sized from the desktop by the user dragging on the lower-right corner, many programs enforce a minimum size to the drag outline. In the program I was fiddling with, the window outline could be collapsed to right down to a ridiculously small size (one character wide by two high). Now it's easy enough to enforce a minimum size when honouring the AES request to resize a window, but how does one force the AES to not allow the drag outline to shrink beyond some minimum?

Brad

Where is the english version of Gemini? I believe I got it once, but it was in German. (Unless I'm thinking of another desktop program..) And what is the latest version number?

I have NeoDesk right now, but haven't seen any updates to it for a long time. Its nice, but it lacks things, like a command line, that would be nice. Its printer queue system is nice, but since I use a laser anyway, it doesn't matter.. :)

Thanks.

>> force users to use -mshort
> EXPLETIVE! ... 16-bit ints are OLD and USELESS

Well, I wouldn't go so far as to say they're old and useless. Like most
everything else we programmers have in our arsenals, there are times when
they're very useful and appropriate, and other times when they are not.

But, forcing users to throw away half the functionality of their compiler
just to use a particular library does not strike me as the proper way to
conduct business as a library author.

Quite likely what I'll do is first release a GemFast for GCC that
requires -mshort (because it's about ready to release), and then follow
that up as quickly as possible with the 32-bit version.

>
>These data types were *always* well-defined on the Atari:
> WORD 16 bit signed
> UWORD 16 bit unsigned
> LONG 32 bit signed
> ULONG 32 bis unsigned

Everyone keeps suggesting this. It doesn't work. There's one very good reason it doesn't work:

The sizes (in bits) for each of these types is well-defined. The types are not. In the (entirely misnamed) PORTAB.H files for various compilers, the WORD type is sometimes defined as short, sometimes as int. While one can count on it being 16 bits, one cannot count on the datatype. If the datatypes don't match and pointers are involved, the compiler will complain, regardless of the underlying size of the type.

And this is not to mention how incredibly wrong the choice of the word WORD is in representing an always-16-bit type. When I started in the computer world, a word was 32 bits on the machines I used. (IBM mainframes.) In general, a word is the "natural data size" of the platform.

>something different (and using int there *is* ineffective, and I hate
>that!), then it needs to be fixed - not necessarily by you.

The other problem is that GCC is ANSI compliant, and many of the other
products aren't. It's easy for people to throw around mud and say
that the others are wrong - that doesn't give an answer.

The point is:

a) The C language does NOT define either int or short to be 16 bits
long. Official references such as K&R, H&S and ANSI documents
specifically state that the lengths can vary from compiler to
compiler.

2) GEM libraries need to use a type that can be guaranteed to be 16
bits long, and since there is no intrinsic C type that is guaranteed
to be 16 bits long, saying "let's use 'short'" is NOT good enough.

Even "short" will NOT be portable, and that's not acceptable. It's
easy enough to say "Let's use short just to spite the people that use
GCC," but that's not kind. Nor is it useful. Sometimes people
develop useful STuff using GCC; cutting them (us :-)) off just for
spite would be foolish.

>TurboC / PureC is no real problem, since both only support 16-bit ints,
>so you could easily exchange the 'int' with 'short' in the include files
>and everything will still work.

It's still not portable, because C does not define either shorts or
ints to be 16 bits.

The issue is fundamentally the portability of code that wants to use
16 bit values, in a language that leaves the sizing of variables to
the compiler designer.

It should be straightforward enough to use GWORD or int16; it would be
necessary to have a compiler-dependent definition of whatever typedef
is made up, but that's merely a line of #define/typedef.

I'm relatively indifferent to whether GWORD or int16 are used. The
former, GWORD expresses the functional use of the type, that being to
pass values used in GEM around. The latter explicitly states the size
of the type. Either should be ok.

>devices will mean that you have to use an adaptor? Strange if it is
>like that. How does the Multisync connect?

I'm not quite sure why you're so hung up on this idea of an adapter.
It's no big deal. A VGA monitor has a DB15 plug on the end of its cable.
The Falcon has a DB19. To hook up a VGA monitor, you first plug in the
DB19->DB15 plug that comes with the Falcon. Then you plug your VGA
monitor cable into it. Net effect: the cable sticks out about 1.5"
further than it otherwise would, because that's about how long the
DB19->DB15 adapter plug is. No big deal.

It's the same story for an SC1224, except the plug is a DB19-DIN10.

The reason for the DB19 connector is that the Falcon provides some video
signals that aren't needed for VGA or SC1224 operation, but are needed if
you intend to use a video processor to genlock and merge Falcon-sourced
video images with external-sourced video images.

> How do you tell the Falcon to use TV resolutions.

It just knows. VGAs provide a monitor-id signal on 3 of the pins of
their connectors. If the Falcon doesn't see signals on these pins stating
that a VGA monitor is connected, it runs in TV mode. (I think. It's all
automatic, and this is my theory of how it's automated internally.)

When a VGA monitor is connected, some of the possible combinations in the
desktop's Video Modes dialog are not accessible.

> Dual-ported RAM.

Sometimes called VRAM, each ram chip has an onboard shift register which
can be read by the video chip (on a separate set of lines) at the same
time that the main processor (or blitter chip) is reading/writing on the
main bus lines. The net effect is that memory access by the video shifter
chip to keep the screen refreshed does not interfere with what the main
bus's processors are doing; it eliminates cycle stealing for video refresh.

Flash II supports split-rate connections, and does it without needing any special RTC/CTS fix software installed. (I'm currently running 19.2k on the ST<->modem connection, and 2400bps on the modem<->Nyx connection as I type this.)

For information on upgrading Flash 1.x to Flash II, send email to jtrautschold@bix.com. (Flash II v2.1 has just been released, it fixes most of the bugs in the v2.0 release of last year. It also comes with quite a nifty installation program, if I do say so myself (having written it)).

NTJ>in a manner which insulates user from internal details and always
NTJ>present an interface as specified without second guessing what people
NTJ>from Atari meant when they were writing 'int'.

That may be true - but you can't isolate the user, since you get structs
back from GEM (like GRECTs, ICONBLKs etc.), and sometimes you do not get
these via library calls, so the library cannot convert the types, and
you cannot acces them the right ways when using int.

Atari specified int in a time when there was just one compiler, and
surely noone thought about problems which would arise when some day a 32-
bit compiler would come - but it has, and so we have to do something
against the *existing* portability problems.

The answer is *not* to ignore messages at all - there is a bug in 2.06
which can be fixed using ARROWFIX. The bug only occurs in certain
situations (I think there was something about accessories using VA- or
some other protocol). There is no safe method to ignore the false
messages that will work on other TOS versions.

According to the "Atari Profibuch", v_cellarray is not implemented in the ROM-VDI; it may or may not be available in a printer driver.

Uniterm works in the ST-compatible video modes, as long as MultiTOS is Not
running. My overscan-compatible patched version runs in the 2 and 4 color
modes in regular 640x480 resolution as well, but doesn't cope with more
bitplanes than that. (oh well.)

NeoDesk lacks a command line because Gribnif sells that as a separate
product - NeoDesk CLI which is a NeoDesk Accessory with a rather complete
shell language and can even run .TOS and .TTP programs in its acc window.
I've got it, but don't use it all that much as you can do so much from
NeoDesk itself...

] Go with GEMINI. DC-Desktop is feature-starved, as is Teradesk (differing
] s not-with-standing).

Teradesk!? Feature starved!? Which version?

Ignoring external shells (such as MUPFEL), Teradesk has quite a few
more features! (I'll have a look at the last Gemini later, and see if
I can do a comparision).

Teradesk is also a LOT smaller and faster than Gset seen /thread

Gemini!

Depends on your pref's I suppose, Gemini, 2meg of RAM is minimum due to
the large executable size preventing you from running any large
programs. Teradesk will run okay in 1meg, but still, I can't see how
anyone operates properly in less than 2meg of RAM! (1meg using
plain old TOS 1.2 is almost unbearable....)

>That sounds kinda silly to me. Of course it's logical to make a long 64-bit if
>the CPU can handle such numbers efficiently but what's the use of making
>ALL types 64-bit? Why not make char 8-bit, short 16-bit and int 32-bit?

On some machines, addressing these smaller quantities take a lot of processing:
Just to add X to a char on a 64-bit machine requires:

get 64-bits of data,
make a copy of it
shift X to align with those bits,
add X,
mask to just those 8 bits,
mask the copy to all but those 8 bits,
merge them,
store data.

It's not worth it.

Even MORE problems occur once you start multithreading on such a machine -
you must stop other processing that require the other chars in the 64-bits
while you hold it temporarily.

This function doesn't exist. I guess that it has been only documented
for some strange graphics cards.

KS>It is not clear to me why the bindings can translate GRECT's, but cannot
KS>translate ICONBLK. By doing something like that you really create problems!

]One example where you can't convert ICONBLKs in your bindings: create a
]ressource file and load it via rsrc_load(), then you get 16-bit-ints in
]the ICONBLK structures. Everything works fine, eg using objc_draw() or
]form_do(), since the AES expects 16-bit ints. Now think you get the
]address of the tree via rsrc_gaddr, calculate the pointer to some object
]and follow the pointer to the ICONBLK. You can't convert anything when
]accessing this ICONBLK since there is no library call involved.

So the proper solution is very clear (but not very efficient):

In user space the ICONBLK structures are int-based. Upon library call
you translate them to the corresponding short-based GEM structures.
This should probably be done by copying; and this might be tricky, as
you are copying some recursive structures (i.e. object trees.)

This is the consistent way to follow if you decide that GRECT has (32 bit)
int as its elements. And thus is a major argument (IMHO) to use short /
a short based typedef as the type used in GEM bindings.

w> >OK, you write your nice portable programs that use the VDI drivers, and
w> >I'll write straight to screen memory.. We'll see whose program sells best.
w> I would not buy your program. Period.

While we're on the subject. I'm writing a graphics terminal that works with alot of VDI, fonts, sound, etc. I was thinking about how best to store the data for the window, and it was suggested that I just save teh VDI calls, but what happens when a user changes the window size or scrolls the window ? I'll have a REALLY tough time on the speed.

My solution is to move logbase to a blitter buffer (I was gonna have blitter buffers anyway for fast screen updates and animation and such, but I wasn't planning on moving logbase). I assume that I could then do my drawing to this buffer in full-screen, nice and fast and I wouldn't have to EVER redraw it. Now, when the CPU gets free (maybe the default: case of a switch statement will detect when no user input has been made (with a small timer in there too) and will check the input buffer on the modem and read in characters, if there are some it draws, if there aren't any then it blitz whatever area has "changed" into the visible portion of the window. Window scrolling should be REAL fast now. As will redraws. I suppose that if the full-screen gadget is clicked on I could move physbase to the buffer (after calling wind_update) too for a real full-screen terminal (no status bar).

Now, is it legal to toggle logbase between applications like that? I thought about multitasking and logbase is per application. Any other problems with doing things this way? Will moving physbase cause a problem (I think I have to restore it when I make any AES call though, right?)

Anyway, any help or comments would be appreciated. The protocol itself is just about done.

The Falcon can only record in 16 Bit stereo. The modes you mention are only
usable for playing sounds. So you have to convert the stereo sounds before
saving them, if you need for example 8 bit mono. That's no problem even
if you just use the CPU (not the DSP) for this task.

>thing. I don't know what dual-ported RAM is, but maybe it is something
>similar?
No separate screen RAM suffers from the problem that not both processor
and videochip can access the videoram. It has the advantage that the
videoprocessor does not burden the CPU to RAM bottleneck. The IBM PC
and compatibles suffer from this problem if I am correctly. The
transfer speed from main memory via the bus to the video memory is
rather slow. The video processor doing DMA to main memory would speed
up things a bit but that could cause bus contention again. Dual ported
RAM has the advantage that both video processor and CPU can use the ram
at the same time. But this RAM is expensive.

So this is how I think things are. But I could be wrong, so correct me
if necessary.

Erlend.

1802. HSC atol function

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-30 13:14:49 UTC
From: richards@elmer.orl.mmc.com
Message-ID: <1993Mar30.131449.19927@iplmail.orl.mmc.com>
Source record: 39593

I have not been able to get HSC 1.4's atol() function to work properly.
It seems to bomb out when the string contains numbers greater than 2^16.
I used a piece of C code that works fine under Unix. Also, the strtol
function doesn't seem to work either.

I tried:
```
nLong=strtol(strbuf, (char **)NULL, 10);
```

With no success. Any help would be appreciated.

>> screen memory in dual-ported ram
> isn't dual-ported ram terribly expensive?

It is certainly more expensive, but not terribly so. Of course, it would be too expensive to outfit a system with 14mb of dual-ported ram. That's why it would be necessary for Atari to define a fixed location for the screen as part of such a scheme. They might mandate, for example, that the screen can be placed anywhere in the low 2mb of memory, and then put just 2mb of the special ram in the system. This would still allow page-flipping within the screen-memory-window area (ie, the screen wouldn't be nailed to exactly one memory address, as it is in msdos machines).

Given that video cards for msdos machines frequently come with 1 or 2mb of dual-ported VRAM nowadays, at reasonable prices, I don't think the cost would be prohibitive.

It would, however, be completely incompatible with some current ST programs, which believe they can set Physbase() to anywhere they want.

1808. Re: Falcon compatibility list?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-30 17:18:34 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Mar30.171834.12181@mnemosyne.cs.du.edu>
Source record: 39599
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have yet to find a piece of non-game software that doesn't run on the Falcon, with one big caveat: some things only run in ST-compatible video modes. (Tempus falls into that category.)

This is using plain TOS 4.0x. I've found a variety of things that won't run under MultiTOS on the Falcon.

Source record: 39600

```
> HSC 1.40 atol() and strtol() broken

I'm not sure about atol(), but a bad old version of strtol() found its
way into the v1.40 release. (mea culpa).

Here's a version of strtol() that should work:

#include <stdio.h>
#include <string.h>
#include <ctype.h>

/*
* note: For strict ANSI conformance, these functions need overflow
* checking and should set errno.
*/

static char digits[] = "0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ";

unsigned long strtoul(string, pnextchar, base)
char *string;
char **pnextchar;
int base;
{
register char *p;
register char *numstr = string;
register int nconv = 0;
register int neg = 0;
register unsigned long value = 0;
register unsigned long lbase = base;
register char *pdigits = digits;

if (base < 0 || base == 1 || base >= sizeof(digits)) {
goto BADBASE_EXIT;
}

while (isspace(*numstr)) {
++numstr;
}

if (*numstr == '-') {
neg = 1;
++numstr;
} else if (*numstr == '+') {
++numstr;
}
```

```
if (lbase == 0) {
if (*numstr == '0') {
++numstr;
if (toupper(*numstr) == 'X') {
++numstr;
lbase = 16;
} else {
++nconv; // a standalone 0 counts as 1 converted digit!
lbase = 8;
}
} else {
lbase = 10;
}
} else if (lbase == 16) {
if (numstr[0] == '0' && toupper(numstr[1]) == 'X') {
numstr += 2;
}
}

while (NULL != (p = memchr(pdigits, toupper(*numstr), base))) {
++numstr;
++nconv;
value = (value * lbase) + (unsigned long)(p - pdigits);
}

if (nconv == 0) {
value = 0;
numstr = string;
}

BADBASE_EXIT:

if (pnextchar) {
*pnextchar = numstr;
}

return (neg ? -value : value);
}

long strtol(string, pnextchar, base)
char *string;
char **pnextchar;
int base;
{
return (long)strtoul(string, pnextchar, base);
}

Thanks for the tip (though I had already read that in the Maus). I think my problem is more severe than that - I can't even start programs from the desktop, and TOSWIN crashes after less than one minute. I'll try it anyway.

Jens.

It's quite simple: simply add some window control elements when creating
the window (SLIDER, SIZER, ARROWS) - the minimum size depends on the
number and kind of control elements!

In January there was an upgrade to NeoDesk, the US version is on a.a.u.e .
Gribnif has also announced NeoDesk V4.0 available sometime soon.

Gribnif also has a command line available that is rather spartan but does
work.

From: rincewind@discworld.oche.de
Message-ID: <2bba33f263801@discworld.oche.de>
Source record: 39603

In <2bb73f00173cce@discworld.oche.de>,
I wrote:

```
RaMS>rsrc_gaddr(R_TREE,TESTTREE,&tree);
RaMS>x = (ICONBLK *)(tree[ICON1].ob_spec)->ib_xchar;
```

I missed a pair of parentheses. In PureC, the following works:

```
x = ((ICONBLK *)(tree[ICON1].ob_spec.iconblk))->ib_xchar;
```

as PureC declares ob_spec as an union, so without the union

```
x = ((ICONBLK *)(tree[ICON1].ob_spec))->ib_xchar;
```

should work as I suggested. However, the problem which we discussed remains :-)

1815. Help needed with grf_memblit() from HSC 1.4

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-31 01:19:18 UTC
From: elvis@watserv.ucr.edu
Message-ID: <28255@galaxy.ucr.edu>
Source record: 39604

```
Hi,
I've been trying to get grf_memblit() to work in order to be able to redraw
the screen in a program I'm working on. As I understand it, you need something
such as the following:

void *buffer;

buffer = grf_memblit(NULL, NULL, &gl_rwdesk);

(where gl_rwdesk is a GRECT holding the area to be saved) in order to save
the screen, and then:

grf_memblit(NULL,buffer,NULL);

in order to redraw it. Unfortunately, it crashes during the first call. If I
pass NULL for the GRECT the first time (instead of gl_rwdesk), it simply
returns 0, indicating it couldn't copy the area. gl_rwdesk is defined by
GEMFAST, so I thought I would try getting the coordinates by hand, into another
GRECT. It still crashes whenever I pass the pointer to the GRECT. I tried
printing out the coordinates in gl_rwdesk, and they all seemed fine. So we
finally get to the questions... I was wondering if someone out there who has
used this function could offer some help? Am I doing something horrendously
wrong in the above calls? Or is there something deeper and more mysterious
at work? Any help would be appreciated.

Thanks,
Andrew Cullum (elvis@watserv.ucr.edu)

1817. Hi Ho UniTerm

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-31 05:35:32 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1pbaj4INNn8e@tamsun.tamu.edu>
Source record: 39616

Who still uses UniTerm? (Please post to Net)

I do. But this ageless software is aging. It doesn't take advantage of the aditional hardware on the newer machines and it is becoming less MiNT and MultiTos usable with every MultiTOS release.

So what can this group do? Howard, how open is Simon about releasing the code? I seem to remeber you updated it somewhat. Would it be possible to do a subroutine by subroutine conversion to C? I don't think someone should try to re-write the program from scratch, but rather convert it piece by piece.

I say C becuuse it seems to be the popular language for MiNT and MultiTOS. Whatever language it is in should support MultiTOS, be aware of Minix FS, fork a download process, and handle multiple communication lineses, and support a variety of terminals (user terminals like the Atari console, or a VT 100 terminal emulation that another user is running to dial into an Atari MiNT system and then dialing out to save money and make the Atari Sysop go broke).

If Simon would release the code to the public (did he ever make any money on it? I offer him some but he never wrote back.) then maybe we could contribute it to GNU. Of course it would be far less portable than a No. 2 pencil (which I think is the portability standard that current GNU programs conform to), but it would keep this good and free program alive. For Emulation, I have never seen anything more reliable since I started using it in 1987 (and I have spent a lot of money trying many alternatives).

Maybe it could be called MultiTERM (reverse of the trend from Multics to UNIX) or LuniTerm (if readers believe I am a lunatic for even suggesting this).

In <1993Mar29.200544.4585@mnemosyne.cs.du.edu> ilepore@nyx.cs.du.edu (Ian Lepore) writes:

]>What's wrong with using WORD/UWORD/LONG/ULONG?
]>
]>These data types were *always* well-defined on the Atari:
]> WORD 16 bit signed
]> UWORD 16 bit unsigned
]> LONG 32 bit signed
]> ULONG 32 bis unsigned

] Everyone keeps suggesting this. It doesn't work. There's one very good
]reason it doesn't work:

] The sizes (in bits) for each of these types is well-defined. The types
]are not. In the (entirely misnamed) PORTAB.H files for various compilers,
]the WORD type is sometimes defined as short, sometimes as int. While one
]can count on it being 16 bits, one cannot count on the datatype. If the
]datatypes don't match and pointers are involved, the compiler will
]complain, regardless of the underlying size of the type.

When done consistent, it does work. A pointer to a WORD will always point
to a WORD -- which is with some compilers a short, and with others an int.
But one specific compiler will see only one typedef (preferably over a
#define) of WORD -- and thus will not complain! This will mean that
GRECT, ICONBLK etc. all must be defined in terms of WORD.

] And this is not to mention how incredibly wrong the choice of the word
]WORD is in representing an always-16-bit type. When I started in the
]computer world, a word was 32 bits on the machines I used. (IBM
]mainframes.) In general, a word is the "natural data size" of the
]platform.

How true. GWORD, INT16 or int16 are better choices.

>I've got it to work now (at least, I think). I uses XYZ202B instead of
>GemZmodem and everything has worked OK since then...

Since you guys are discussing hi-speed modem problems, I thought I'd throw in a problem I've been having...

I'm using a TT w/TOS 3.01, ZyXEL 1496E (5.05), STalker 3.01, AUXINIT.PRG and RS232ENC.PRG.

My problem is this: I start a download with STalker as an accessory, and then run a TOS (GIFDCDTT.TTP for example) program. After about 20 seconds or so, the 'receiving data' light on my modem will go out. When I exit from the TOS program, the tranfer does not continue, it just hangs and I am forced to abort.

I think I know why the xfer stops when I'm in a TOS program; once the 31kb buffer set with AUXINIT.PRG is filled, the computer tells the modem to stop sending data (is this the DSR or RTS?). STalker can't do anything, as it can only empty the buffer when the AES is active (right?). But when I exit the TOS program, shouldn't STalker empty the buffer and RS232ENC tell the modem that it's ok to continue?

Also, should I be using Serial Patch instead of RS232ENC? I've had no other problems with RS232ENC, but experience some a long time ago when I tried Serial Patch.

Any comments? suggestions? Thanks!

Hi guys!

A quick question for European ST fans. I need to know about ST mags in Europe (except UK and Germany) for an article I'm about to write. There was a mag in France called "Atari magazine" but it seems to have disappeared. The only Dutch mag I know it's still going is the excellent "Atari ST Nieuws".

Anyway, if you'd mail me the list of ST mags in your country I'd really appreciate it. (A few words about the current state of the ST market wouldn't hurt either.) Please send personal mail since my Internet feed is sporadic...

Thanx in advance! If the rest of you are interested I'd be more than happy to post the resulting list.

Don

hmm, changes to logbase or physbase (or any screen related Xbios calls) will
not work with any special graphics card (VGA or hi-res or real-true-color
cards) because the screen memory is not in the standrad memory range.
I think it would be best to use vro_cpyform calls.

>

Yes indeed pipes; I will start by saying that your baby
will have to be quite something to tempt me away from tcsh.

Have you had a look at Helios, by Perihelion. This is intended for use
with multi-processors/multi-processes.

One feature I particularly like in Helios is the ability to specify
reverse direction pipes (i.e. data flow right to left along command line),
and bi-directional pipes.

best of luck (but take care not to re-invent too many wheels - there
is so much that needs doing)

cheers
beau webber

1829. Latest Picture Formats List

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special

information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom

(i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note that this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

Note that the Spectrum 512 mode's three palette changes per scan
line allow more colors on the screen than normally possible, but a
tremendous amount of CPU time is required to maintain the image.

The Spectrum format specifies a palette of 48 colors for each scan line.
To decode a Spectrum picture, one must be know which of these 48 colors
are in effect for a given horizontal pixel position.

Given an x-coordinate (from 0 to 319) and a color index (from 0 to 15),
the following C function will return the proper index into the Spectrum
palette (from 0 to 47):

```
/*
* Given an x-coordinate and a color index, returns the corresponding
* Spectrum palette index.
*
* by Steve Belczyk; placed in the public domain December, 1990.
*/
int
FindIndex(x, c)
int x, c;
{
int x1;

x1 = 10 * c;

if (1 & c) /* If c is odd */
x1 = x1 - 5;
else /* If c is even */
x1 = x1 + 1;

if (x >= x1 && x < x1 + 160)
c = c + 16;
else if (x >= x1 + 160)
c = c + 32;

return c;
}
```

<Spectrum 512 (Compressed)> *.SPC

```
1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
--------------
<= 50014 bytes total
```

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

NOTE: Regarding Spectrum pictures, Shamus McBride reports the following:

"... [The Picture Formats List] says bit 15 of the color map vector
must be zero. I've encountered quite a few files where [bit 15] is
set (with no associated palette entry)..."

<Spectrum 512 (Smooshed)> *.SPS

This format compresses Spectrum 512 pictures better than the standard
method. There are at least two programs that support this format, SPSLIDEX
and ANISPEC, although the two seem to differ slightly in their interpretation
of the format.
One point of interest: Shamus McBride deciphered this format without an ST!

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= ? bytes compressed data bit map
<= ? bytes compressed color bit map

< ? bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to that used in Spectrum Compressed (*.SPC) pictures.

The data map is stored as a sequence of records. Each record consists of a header byte followed by one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x (unsigned):

0 <= x <= 127 Use the next byte x + 3 times
128 <= x <= 255 Use the next x - 128 + 1 bytes literally
(no repetition)

There are two kinds of *.SPS files.

The data may appear in the same order as *.SPC files (SPSLIDEX format?):

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

The second variant (ANISPEC format?) encodes the data as byte wide vertical strips:

Picture data, bit plane 0, scan line 1, columns 0 - 7.
Picture data, bit plane 0, scan line 2, columns 0 - 7.
Picture data, bit plane 0, scan line 3, columns 0 - 7.
. . .
Picture data, bit plane 0, scan line 199, columns 0 - 7.
Picture data, bit plane 0, scan line 1, columns 8 - 15.
Picture data, bit plane 0, scan line 2, columns 8 - 15.
. . .
Picture data, bit plane 0, scan line 199, columns 312 - 319.
Picture data, bit plane 1, scan line 1, columns 0 - 7.
. . .
Picture data, bit plane 3, scan line 198, columns 312 - 319
Picture data, bit plane 3, scan line 199, columns 312 - 319.

A for loop to process that data would look like

```
for (plane = 0; plane < 4; plane++)
for (x = 0; x < 320; x += 8)
for (y = 1; y < 200; y++)
for (x1 = 0; x1 < 8; x1++)
image[y, x + x1] = ...
```

Color map compression:

Color map compression is similar to *.SPC color map compression, but the map is compressed as a string of bits, rather than words. There are 597 records (one for each palette). Each record is composed of a 14-bit header followed by a number of 9-bit palette entries. The 14-bit header specifies which palette entries follow (1 = included, 0 = not included). The most significant bit of the header refers to palette entry 1, while the least significant bit refers to palette 14. Palette entries 0 and 15 are forced to black (zero). Each palette entry is encoded as "rrrgggbbb".

The format of the palette is described above in the section on uncompressed
Spectrum pictures (*.SPU).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)

32000 bytes total

<Cyber Paint Sequence> *.SEQ (low resolution only)

This format, while fairly complex, yields excellent compression of animated
images while offering reasonably fast decompression times.

1 word magic number [$FEDB or $FEDC]
1 word version number
1 long number of frames
1 word speed (high byte is vblanks per frame)
118 bytes reserved
----
128 bytes total for .SEQ header

for each frame {
1 long offset to data for this frame, in bytes [basically useless]
}

for each frame {
1 word type (ignored?)
1 word resolution [always 0]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits [not used]
1 word color animation speed and direction [not used]
1 word number of color steps [not used]
1 word x offset for this frame [0 - 319]
1 word y offset for this frame [0 - 199]
1 word width of this frame, in pixels (may be 0, see below)
1 word height of this frame, in pixels (may be 0, see below)
1 byte operation [0 = copy, 1 = exclusive or]
1 byte storage method [0 = uncompressed, 1 = compressed]

1 long length of data in bytes (if the data is compressed, this
will be the size of the compressed data BEFORE decompression)
60 bytes reserved
----
128 bytes total for frame header

? bytes data
}

Frames are "delta-compressed," meaning that only the changes from one frame to the next are stored. On the ST, .SEQ files are always full-screen low resolution animations, so the sequence resulting from expanding all the data will be n 320 by 200 pixel low resolution screens, where n is given in the .SEQ header.

Since only the changes from frame to frame are stored, image data for a frame will rarely be 320x200 (except for the very first frame, which will always be a full screen). Instead what is stored is the smallest rectangular region on the screen that contains all the changes from the previous frame to the current frame. The x offset and y offset in the frame header determine where the upper left corner of the "change box" lies, and the width and height specify the box's size.

Additionally, each "change box" is stored in one of five ways. For each of these, the screen is assumed to have the full-screen image from the last frame on it.

o uncompressed copy: The data for this frame is uncompressed image data, and is simply copied onto the screen at position (x, y) specified in the frame header.

o uncompressed eor: The data for this frame is exclusive or'ed with the screen at position (x, y).

o compressed copy: The data for this frame must be decompressed (see below), and then copied onto the screen at position (x, y) specified in the frame header.

o compressed eor: The data for this frame must be decompressed (see below), and then exclusive or'ed with the screen RAM at position (x, y).

o null frame: The width and/or height of this frame is 0, so this frame is the same as the previous frame.

Of the 5 methods above, the one that results in the smallest amount of data being stored for a particular is used for that frame.

Compression Scheme:

Compression is similar to that employed by Tiny, but is not quite as space-efficient.

Control word meanings:

For a given control word, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 32767).
x > 0 Specifies the number of times to repeat the next word
taken from the data section (from 1 to 32767).

Note that a control word of 0 is possible but meaningless.

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead the four
bitplanes are separated, and the data within each bitplane is presented
vertically instead of horizontally. (This results in better compression.)

To clarify, data for a full screen would appear in the following order:

bitplane 0, word 0, scanline 0
bitplane 0, word 0, scanline 1
...
bitplane 0, word 0, scanline 199
bitplane 0, word 1, scanline 0
bitplane 0, word 1, scanline 1
...
bitplane 0, word 1, scanline 199
...
bitplane 0, word 79, scanline 199
bitplane 1, word 0, scanline 0
...
bitplane 3, word 79, scanline 199

Note however, that the data does not usually refer to an entire screen, but
rather to the smaller "change box," whose size is given in the frame header.

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major) [< 2]
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<Animaster Sprite Bank> *.ASB (low resolution only)

```
1 word number of frames - 1
1 word ?
1 byte maximum width, in pixels
1 byte maximum height, in pixels
16 words palette
--------
38 bytes total for header

For each frame {
1 word width of this frame (in pixels) - 1
1 word height of this frame (in pixels) - 1
1 word ?
? words image data (words of screen memory)
}

<STOS> *.MBK

9 words ?
1 long $19861987 (magic number?)
1 long offset from this long to header for low resolution
parameter block (if past end of file, no low res frames)
1 long offset from this long to header for med resolution
parameter block (if past end of file, no med res frames)
1 long offset from this long to header for high resolution
parameter block (if past end of file, no high res frames)
1 word number of low resolution frames
1 word number of medium resolution frames
1 word number of high resolution frames

For each frame {
1 long offset to data (probably only used internally by STOS)
1 byte width in words (multiply by 16 to get width in pixels)
1 byte height in pixels
1 byte X hotspot location
1 byte Y hotspot location
}

(The format implies other stuff could be here.)

1 long ["PALT" $50414C54]
16 words palette

? words of data for each frame, in the order mentioned in the
header. Monoplanar mask data follows image data for each frame.
----------
? words total

The frames often seem to be in semi-random order, not necessarily in
the order they are to be animated.

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
```

1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines

? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored separately starting with plane 0. There is, however, no standard way of storing the color palette. Some programs may save the palette in separate files, some may extend the header. For this reason, you should never assume the header is 8 words long, always get the header length from the 2nd word of the header. Also, the line width in the 7th word is the number of pixels in a line. Since the data is encoded in byte-wide packets, the actual unpacked line width is always a multiple of 8, and may be 1-7 pixels longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern length" word in the header. Repeat this pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline is to be used multiple times. Read the following record:

1 byte flag byte [$FF]
1 byte number of times to use next scanline data

The data for the next scanline follows, compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte determines the number of bytes to use literally. The literal data bytes follow.

otherwise Solid run. The value of x determines what to draw. The high bit specifies whether the pixels are set or cleared. A 1 indicates a byte-run using $FF, a 0 indicates a byte-run using $00. The low 7 bits, taken as an unsigned quantity, specify the length of the run in bytes.

<GEM Metafile> *.GEM

Marcel Boom <mboom@mswe.dnet.ms.philips.nl> recently sent me this
format description. I have reproduced it here, largely unchanged.

The file consists out of a header and the data records. The header has
the following format:

word mf_header: should be -1, which indicates a metafile
word mf_hlength: The length of the header part (usually 24 words)
word mf_version: Version number (usually 101)
word mf_ndcrcfl: 0: NDC coordinates, 2: Raster coordinates
word mf_extends1: Optional, minimal used x coordinate
word mf_extends2: Optional, minimal used y coordinate
word mf_extends3: Optional, maximal used x coordinate
word mf_extends4: Optional, maximal used y coordinate
word mf_width: Optional, page width in 0.1 mm
word mf_height: Optional, page height in 0.1 mm
word mf_coords1: Optional, coordinate system param 1
word mf_coords2: Optional, coordinate system param 2
word mf_coords3: Optional, coordinate system param 3
word mf_coords4: Optional, coordinate system param 4
word mf_imgflag: 0: No images, 1 contains bit images
word mf_reserved1: reserved.
.
.
word mf_reserved9: reserved.

After the header follows the data records of the following format:

word 0: VDI command number
word 1: n: Number of parameters for ptsin array
word 2: m: Number of parameters for intin array
word 3: Subopcode
word 4 to 4+n: ptsin array
word 4+n to 4+n+m: intin array

A VDI command number of -1 signals the end of file.

VDI command numbers:
5: Escape functions:
Subopcode:
1: Inquire addressable character cells
2: Exit alpha mode
3: Enter alpha mode
20: Form advance
21: Output window
22: Clear display list
23: Output bit image file
98: Update metafile extents
99: Write metafile item
100: Change GEM VDI filename
6: Polyline

7: Polymarker
8: Text
9: Filled area
11: GDP:
subopcode:
1: Bar
2: Arc
3: Pie
4: Circle
5: Ellipse
6: Elliptical arc
7: Elliptical Pie
8: Rounded rectangle
9: Filled rounded rectangle
10: Jutified graphic text
12: Set character height, absolute mode
13: Set character baseline vector
14: Set color representation
15: Set polyline linetype
16: Set polyline line width
17: Set polyline color index
18: Set polymarker type
19: Set polymarker height
20: Set polymarker color index
21: Set text face
22: Set graphic text color index
23: Set fill interior style
24: Set fill style index
25: Set fill color index
26: Inquire color representation
32: Set writing mode
35: Inquire current polyline attributes
36: Inquire current polymarker attributes
37: Inquire current fill area attributes
38: Inquire current graphic text attributes
39: Set graphic text allignment
102: Extended inquire function
103: Countour fill
104: Set fill perimeter visibility
106: Set graphic text special effects
107: Set character cell height, points mode
108: Set polyline end styles
112: Set user defines fill pattern
113: Set user defined line style pattern
114: Fill rectangle
117: Inquire character cell width
129: Set clipping rectangle
131: Inquire current face information

The meaning of the arrays can be found in the several GEM programming books.

NOTE: The word qualifier is not the Motorola word, but the Intel word,
so high and low byte are swapped!

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
----
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

```
For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)
```

```
4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk (note that "ILBM" is not a chunk ID). This is the number of
bytes that FOLLOW the 4 ID bytes and size longword. The exception to this is
the FORM chunk. The size longword that follows the FORM ID is the size of the
remainder of the file. The FORM chunk must always be the first chunk in an
IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data
```

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

```
line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]
```

The FORM chunk identifies the type of data:

```
"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)
```

<MacPaint> *.MAC

```
1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
-------------
512 bytes total for header

< 51200 bytes compressed bitmap data
-------------
< 51712 bytes total
```

NOTE: The version number is actually a flag to MacPaint to indicate if
the brush/fill patterns are present in the file. If the version is 0,
the default patterns are used. Therefore you can simply save a MacPaint
file by writing a blank header (512 $00 bytes), followed by the packed
image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The packing method is PackBits (see below). There are 72 bytes per
scan line. Each bit represents one pixel; 0 = white, 1 = black.

<RGB Intermediate Format> *.RGB (low resolution only)

This format was invented by Lars Michael to facilitate conversions between
standard ST picture formats and higher resolution formats like GIF and IFF.
It supports 12 bits of color resolution by keeping the red, green and blue
components in separate bit planes.

1 word resolution (ignored)
16 word palette (ignored)
16000 words red plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words green plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words blue plane (screen memory)

96102 bytes total

The format was derived by concatenating three DEGAS .PI1 files together --
one for each color gun. The RGB value for a pixel is constructed by looking
at the appropriate pixel in the red plane, green plane, and blue plane. The
bitplanes are in standard ST low resolution screen RAM format, but where pixel
values in screen RAM refer to palette entries (0 through 15), pixel values
here correspond to absolute R, G, and B values. The red, green, and blue
components for each pixel range from 0 to 15 (4 bits), yielding a total of
12 bits of color information per pixel. Not coincidentally, this is exactly
the format of ST palette entries (although on ST's without the extended
palette only the lower 3 bits of each color component are used).

You can view a single bit plane on a standard ST by splitting the .RGB file
into its three DEGAS .PI1 components and setting the palette to successively
brighter shades of gray.

<ComputerEyes Raw Data Format> *.CE1 (low resolution)
*.CE2 (medium resolution)

1 long [$45594553 or "EYES"]
1 word resolution [0 = low res, 1 = medium res]
8 words ?
If resolution = 0 {
64000 bytes red plane, 320 x 200, 1 pixel per byte
64000 bytes green plane, 320 x 200, 1 pixel per byte
64000 bytes blue plane, 320 x 200, 1 pixel per byte

192022 bytes total
}
else If resolution = 1 {
128000 words 640 x 200, 1 pixel per word

256022 bytes total
}

This is almost two formats in one:

Low resolution:

The planes are arranged vertically, instead of horizontally.
The first byte is the red component of pixel (0,0), the second is (0,1),
and the third (0,2). The 201st corresponds to (1,0), etc. The 64001st

byte is the green component of (0,0).
Only the low six bits of each byte are used.

Medium resolution:

The picture is arranged vertically, instead of horizontally.
The first word is pixel (0,0), the second is (0,1), and the third
(0,2). The 200th is (1,0) etc.
Each word is divided up into the RGB values for the corresponding
pixel, as follows:

```
Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 B4 B3 B2 B1 B0 G4 G3 G2 G1 G0 R4 R3 R2 R1 R0
```

Bit 15 is not used.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

* Roland Waldi contributed extensive information on the following formats:

GEM, IMG, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

** John Brochu, ST picture formats guru, provided sage advice and many
corrections to the following formats:

NeoChrome, DEGAS Elite Compressed, Spectrum 512 Compressed,
GEM Bit Image, IFF, MacPaint

Source record: 39628

```
> grf_memblit(NULL, NULL, &gl_rwdesk);

Change that to:

buffer = grf_memblit(GRF_NORMAL, NULL, &gl_rwdesk); // to save screen

grf_memblit(GRF_NORMAL, buffer, &gl_rwdesk); // to restore screen

In general, the GemFast library wants to see NULL only to indicate the
abscense of a *pointer* parameter. The first parameter to grf_memblit()
is not a pointer, it is a short integer containing bitmapped options.
Throughout GemFast, when there is an options parameter there will be a
corresponding XXX_NORMAL constant you can use to indicate that you don't
want any special options on that call (where XXX will be the same as the
first 3 letters of the function name).

I should have listed GRF_NORMAL along with the GRF_BOBJTREE option in the
docs for grf_memblit(); my mistake. I've made a note to update this in
the docs on the next release.

If you mean shuffle data in and out of memory at that speed? Yes, of course.
The serial port is driven by a SCC on a DMA channel. Similar setup as the
DSP hostinterface capable of over 1Mbyte/s (8Mbit/s).

If you mean: Outputing text in a window at that speed, NO WAY! That would
be at 76.8 25*80 character pages a second, and even if it could do so, could
you read this fast?

Disconnect the monitor adaptor!

i> On my TOS 4.02 system, the Compatibility Modes dialog lists only ST Low,
i>ST Medium, and ST high. Nothing about TT modes at all.

One can easily get TT medium by setting 16 colors, 80 columns, no line doubling
on VGA monitors. 256 colors, 40 columns, no line doubling is TT low.

One can't. The AES does this automatically for windows that have arrows and
scroll bars, and does nothing for windows that don't.

Check out the program Connect 1.92, which should be at
atari.archive.umich.edu (with a name like conn192.lzh or similar).
It pretty much has what Uniterm had, but with more features.

Quick summary: VT52/100/102/220/ANSI/Tex4014 emulation, bauds up
to 153600, can use ports Mode1/Modem2/Serial2/LAN/MIDI, is MiNT/MTOS
aware (run transfer in the background), use GDOS fonts (even without
GDOS loaded), is fully GEM oriented - works well under MultiGEM so
I'd think under MTOS as well (advise to use Warp9, NVDI, or
some screen accelerator), has a script langauge (plus learn mode),
VTxxx is fully supported (even double-sized characters and blinking
characters), can have multiple "sessions" open (say a modem on
Modem1, a null modem on Modem2, and another modem on Serial2) each
in it's own window, can assign sounds to various events, at least
30 programmable macro/function keys, etc...

In a way, it's sort of a "Uniterm for the future" and, unlike
Uniterm, it's currently being supported. It's the first
program I've used that's pulled me away from Uniterm.

The one caveat - the documentation is in German (an english
resource file is included, however). Then again, can't say I've
ever read the Uniterm docs either :-)

I wonder if you are using a reset proof ram disk and are only reseting the machine? You might want to make sure you do a cold reboot (or power cycle the machine) to insure that the ram disk has been reset.

Bob

>57600!? Oh dear, weren't there rather a lot of people telling me that
>57.6K was impossible!? (with or without v42bis etc.)

I never said I had a Connect with 57600 bps! The serial line between my
Falcon and my ZyXEL is at 57600 *Baud*! The best Connect I get with my ZyXEL
is 16800bps/V.42bis.

I think 57600bps will never be able on a normal telephone line!

>to use CoNnect V. >= 1.92. V. 1.90 was only adapted to the changed DCD.

Sorry, my mistake. The newest version of CoNnect I know is 1.96. There
you can play Samples (*.SMP) correct on a Falcon.

>P>Sounds nice, have you actually used speeds higher than 19200 succesfully,
>P>without getting garbage on the screen? Does a Falcon really have enough
>P>power to get 153600 through the serial port?

>Rasmus, could you give me something, that runs with 153k6? A modem or so?

153600 Baud could be useful for a small network via null-modem-cable.

>Can't the Falcon do 76800 baud?

The FALCON can do 76800 baud. But if I use that speed with my ZyXEL I get
garbage on the screen if I type at&v for example. I think it's a problem
of the ZyXEL though it recognizes 76800 baud correctly. ATS20? -> 0.
I don't think it would help much if I use 76800 baud instead of 57600.
So I won't spend more time thinking about this problem! :)

>what's the f%^$##%^%^# problem with 3 chip SIMMS ?!?!?!?!

Here goes with an idea.

It could well be something to do with the disabling of the parity bit. Try
connecting CAS8* (pin 28) (and D8 if you wish) to Vcc/Vdd (pin 30) instead
of to GND/Vss (pin22).

Well, it's worth a go. (I must admit, I used 9 chip SIPs)

i want to buy a pascal compiler for my st. does anyone have any suggestions or experience on what might be useful?

i would like to be able to access gem without too much difficulty, but i also would like it to accept pascal code from other platforms. is this too much to ask?

i have tried a demo of pure pascal, which i found to be quite nice. it seems to have all the features i want but i don't know where to get it.

Then again, perhaps you really ought to look at Connect, it sounds like that
program already does the things that you want. Don't think it supports dial-in
sessions, but who knows... I've been considering switching over, but I've
gotten so used to Uniterm it's hard to bring myself to do it.

Source record: 39637

Like the above says - it just gets better. I went to my local atari dealer on wednesday to finally look (hands on) at the new falcon 030. Uh, atari seem to have sent it to south australia or something. It should be here by friday, but ring us before you come - just to make sure they haven't sent it to china or something.

Well atari, this customer is very quickly giving up hope ...

Another thing - price for 4 meg 65HD Falcon is Aus$1950, not too bad, but get this :-
" A video adaptor MUST be purchased seperately; whether you wish to use an ATARI or VGA monitor."
Said adaptor is another Aus$59. What is going on? Will the goddamn thing ever be released? If it is, is this sort of a kit form computer? i.e. you build it youself from components? I'd be interested to hear if the same applies in U.S., U.K., Deutschland, France, etc...

Karl.

(A very disappointed Falcon fan.)

I have a high density drive and the needed kit, to change into my atari 1040ST,
but when I tried to put it in, it didn't work. Then someone told me that my
TOS is too old. I have only TOS 1.2.
Does anybody know what TOS I need at least, to make my high density drive work.
And if, p.e. I need to use TOS 1.6 or higher, do I need an expansion board for
TOS 1.6, or does it fit in my rom-sockets?

thanks in advance
Herry

> Falcon 030, "A video adapter must be purchased...another Aus$59."

That doesn't sound right, are you sure of that? As I've mentioned recently, the Falcon video adapters are just little plugs with 19 pins on one side of the plug, and 15 on the other side. No active electronics in the plug at all.

The closest analog is an RS-232 gender changer. These sell for about $2, so I can't imagine even Atari having the audacity to charge $59 for a funny-shaped plug.

You could easily buy a DB19 plug and a DB15 plug and wire yourself an adpater, spending no more than $5 max on the parts. Someone could easily mass-produce them for about $1 each. So if Atari is really planning on charging $59 (seems unbelievable), it looks like there's a good market opportunity here.

You can add me to the list of people in favor of the split up. Also I would like to suggest the following:

comp.atari.falcon
comp.atari.falcon.tech
comp.atari.falcon.binaries
comp.atari.falcon.sources

What do you think? Lets face it, half of the posts are due to falcon stuff now anyway. But we would keep the ST nets as well, lord knows I can't afford a falcon anytime real soon. Not to mention I want a two piece kit. A Mega Falcon 030, I couldn't afford an 040...

Sure, but I don't know if it is available in the USA. If it is, try Pure Pascal! PurePacal comes from the same company with made PureC and is a fully Turbo-Pascal 7.0 compatible compiler with integrated IDE und objectiv-pascal support. The code-quality is somtimes better than PureC and the compile is realy quick! In Germany it costs about $250,-.

There is a font in the package called CONNECT.FNT which is a little smaller
than the normal ATARI-Font but still well readable.
The only thing you have to to for using it is putting it into your
c:\gemsys folder and in the ASSIGN.SYS if you are using a GDOS.

If you don't want to install GDOS you have to create a GEMSYS folder
in CoNnects directory and place the fonts there.

In both ways you can select the (little) smaller fonts in the Display
dialogue...

Wolfgang

1855. The BEST FTP Site..?

I wish to thank the chaps that run, what I would consider
THE BEST FTP archive site for Atari...

Good on ya Riply and Hesche..

This is ftp.cs.tu-berlin.de 130.149.17.7

1. It allways has the latest suff..
2. It has a good mailer..
3. It has indexs/files for people that only have mail access..
4. Has what is new files.
5. A good commented English index.
6. You get good help from the people that run it..
7. Files are on there with out delay, not like A.A.

So come on you chaps that run rus.uni-stuttgard and tu-clausthal,
you don't have much support for people that only have mail access,
no last 7 day files, or whats new, no commented index, Stuttgard
seems to mainly support German users...

I think I have mailed more files from Berlin than A.A., and its far easyer
to connect to A.A. Than Berlin from here, also Berlin does not drop parts
like A.A. does..

So are there any othere European Site that have support like Berlin,
with good mail support...

How about some feed back on this from other mail users..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

1856. C-Kermit 5A (188)

*** C-Kermit 5A(188) ***

Well any of you that have played with the old Kermit, Uniterm, etc,
should definitively give C-Kermit 5A (188) a try..

File CKER5A.ZOO found on most sites..

Its fast very fast, and its the only protocol
to support wild cards, lets me get all those mailed Uencoded
part files down with out having to worry about there file names..

I had a few finger problems it getting it going, but it now runs
some 100%, I am using the full parser version..

So if your system that you call has C-Kermit 5A, why not give it a try..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

> how this can be done.

Basically, the trick is to open a window, draw a dialog tree in the
window and use a form_do function of your own that detects mouse clicks
and keyboard events that are meant for the dialog. Your form_do
function also has to handle all the possible window events for
the dialog window such as redraw, resize or move events.

The 'minimum size' you mention is always the same and it is in effect exactly
if you have the full slider lot for both directions. E.g. if you have a
window with a VSLIDER, VARROWS etc. but no HSLIDER, HARROWS etc, the size
rubberbox will only have a minimum height, but horizontally you can even get
the right edge left of the left one.

GOOD NEWS!!!!!

My brother just informed me that he found out from one of his fellow Clarkson Engineering graduates who works for Commodore, that Commodore has chosen the RISC chip of future amigas! (drum roll please...) As many have speculated, it is the DEC Alpha! They are planning on announcing this at WOCA-NYC during Lew Eggerechts speech. Better yet they will be showing in a semi-private session the prototype Amiga-A with the Alpha (100Mhz) and the prototype new high-end AAA Chip set! (This computer is not due out until mid 1994, however) Expect truely blinding speed in this speed demon!!!!!

More details as I recieve them.

Message-ID: <1993Apr1.162710.26774@westminster.ac.uk>
Source record: 39483

I am about to get hold of a bare hard drive. So what things do I need to buy ?
I know I'll have to get a case,power supply, and host adapter(ICD The Link)
but is there anything else ?

I've been told that it does not have the same connections as a bare drive
that goes in a PC. Does that mean it's not SCSI and makes it useless ?

cheers for any help.
Phil Shore.

J> Jens
J> --
J> Jens Krinke (krinke@ips.cs.tu-bs.de)

Well, it is working for me. I only recently recompiled rcs 5.6 with
MiNT libs 28 or 29 and it is working just fine with GNU diff 1.15 and
the newer GNU diff 2.2. But you can be right, that it doesn't work for
you, since I made an additional minor modification somewhere in the
signal() code of RCS.

I guess I can zoo it together for you and send it to you. Drop me a
note.

> [suggestions for about a dozen new comp.sys.atari sub-groups]

I still think this is a pretty dumb idea. The Falcon is a TOS-compatible machine. If you're gonna give it its own group, then why not have a special group for TT, STe, STacy, and so on?

In fact, since this newgroup is running 20-25 new messages a day, why don't we just come up with 20 new subgroups, then we can have 1 message a day in each of them?

>is very buggy. Also I tried a high-speed test to see if the RTS/CTS
>handshaking worked like they claimed - nope, it didn't. It seemed to be
>better than when there's no handshaking at all, but it still fails.

Whatever you say. I'm using 19.2k on the ST<->modem connection, with
RTS/CTS flow control, and I don't have any TSR fixing the flow control. I
connect with various systems from 2400bps up through 14.4k V.42bis, and I
have no problems at all.

I suggest you check your modem configuration.

> erronious blanks in the capture buffer

Chances are those aren't blanks, they're FS (0x1C) characters, which
Flash II uses to mark start/stop points for its review feature. I don't
like them either, and there's a good chance that in the next release
you'll have the option of turning off the review feature and eliminating
those FS chars.

1868. Re: Hi Ho UniTerm

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-01 18:44:04 UTC
From: erlingh@storlind.storlind
Message-ID: <ERLINGH.93Apr1184404@storlind.storlind>
Source record: 39456

Quick summary: VT52/100/102/220/ANSI/Tex4014 emulation, bauds up
to 153600, can use ports Mode1/Modem2/Serial2/LAN/MIDI, is MiNT/MTOS
aware (run transfer in the background), use GDOS fonts (even without
GDOS loaded), is fully GEM oriented - works well under MultiGEM so
I'd think under MTOS as well (advise to use Warp9, NVDI, or
some screen accelerator), has a script langauge (plus learn mode),

It does not work with MTOS.
All sorts of bad things happen due to the memory-protection scheme :/
Else, its a _great_ program.
If only it would work with MTOS, I'd start using it and paying for it
immediately.

I guess this is the _very_ old port of ksh (?)
If that is the case, the trouble comes from a bug in the old
mint-libraries. You will have to get hold of the sources to ksh, and
recompile with the mintlibrary at PatchLevel >= 25.

>Rasmus, could you give me something, that runs with 153k6? A modem or so?

Well, maybe there will be such modems soon (I mean for the DTE rate),
but actually I just wondered if it was _possible_ that the Falcon
could drive a 153600 baud serial port, when the ST does 19200. That
would be very much faster, that's all :).

Wowza! A$59 is a tad steep for a dumb adaptor, I reckon. What's that, about
US$45? Gimme a break, here! When you buy a Falcon, you should at least get
your _choice_ of the SC or VGA adaptors then if you want the other one, pay
for it. If they are going to actually ask that much for their adaptors, I'm
going to take up a sideline of making the darn things!

|>
|> Martin

Then the AES isn't handling this quite properly. The closer, fuller and sizer box were defined by the windows, yet when sized down:

1) the closer disappeared;
2) the sizer remained visible but stopped working;
3) the fuller remained visible and continued to work.

Now, adding arrows and sliders might keep the window from getting to this state (I'll try tonight) -- but considering that the title and info bars were also defined I don't think 1x2 characters was the proper sizing. But I suppose if the sliders at least keep the sizing sane, I can make the slider size = 1000 and then ignore any messages about the slider (assuming that the windows weren't to have 'real' sliders).

1876. ICD Link/SCSI floppy question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-01 22:19:02 UTC
From: snoret@egon.unx.sas.com
Message-ID: <C4tsnq.23J@unx.sas.com>
Source record: 39472

I've read posts from people using the ICD Link to hook up a 20MB floptical drive to their ST. What I would like to know is, will the link work with a SCSI floppy (1.44MB/720KB)? I fiddle with hardware at work, including SCSI floppy drives. The drive I have on my desk now can read/write either 1.44MB or 720KB DOS/ST disks. It can also read/write 1.44MB Mac disks.

If I were to attach this type of drive to my ST with an ICD Link, would it work? Would I need MetaDOS or some other special driver software (that perhaps doesn't come with the Link) ?

It sure would be nice to have access to a 1.44MB floppy without going to the trouble of major surgery on my ST. (i.e. replacing controller chip, clock speed settings, etc.)

Thanks in advance,

Rick

1878. Falcon video adapter plug pricing

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-01 23:32:12 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Apr1.233212.25401@mnemosyne.cs.du.edu>
Source record: 39475

Well, with all the rumors flying about pricing on the video adapters for
the Falcon machines, I decided the simplest thing might be: just ask.
So, I called Horizon Atari here in Denver, and they say their retail price
for the adapters will be US$15. Still a bit steep for a funny-shaped hunk
of plastic with some wires in it, but nothing like the US$45 figures that
have been mentioned here.

>it is the DEC Alpha!

It may be a fact worthy of note that today happens to be April 1, no?

If this post had been made on any other day, it would have very
slightly more credibility.

There is no such thing as a Chromax. I doubt it will ever see the light
of day, much like Lexicor's Leonardo board.

Look towards the Crazy Dots and Cybercube boards.

Take a look on Version 1.96. It definitely runs under MTOS. 1.92 used to run but only on the versions of MTOS that were available to this time.

1887. GDOS 1.1 (!) drivers and paper size

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-02 10:18:46 UTC
From: simon@gst-soft.demon.co.uk
Message-ID: <1993Apr02.111504.1@gst-soft.demon.co.uk>
Source record: 39486

Does anybody know of a way to instruct the GDOS 1.1 printer drivers
to use a paper size that is bigger than their built in defaults?
Simply setting a larger clipping rectange doesn't seem to work; I
have some documentation that seems to suggest that you can pass and x
and y number of pixels to the driver when calling the v_opnwk call
and the pass the same values into a vq_extnd call. I can't get this
to work.

Any clues/ideas?

No it is actually for a VME bus expansion box.
:-)
Well could it be done? Just add a VME box to the falcon? I think it can
be done, because the falcon PDS has the necessary signals, but I could
be wrong. So someone with enough knowledge of VME and/or Falcon, tell
us if it can be done. It would be ideal if there is no need for yet
another BUS standard.

Well I think that the tu-clausthal archive is very good. The mailing
service is fast, and it has a LARGE commented index. Also it has all
files in Lharc 2.01 format including subdirs. So now you all know:
ftp.tu-clausthal.de is my favourite atari ftp-site.
Thanks to Wolfgang Ley? for the excellent work he does on the archive.

Erlend.

1895. Floppy Disk Latency

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-02 12:52:03 UTC
From: jimomura@tndb.UUCP
Message-ID: <jimomura.02qq@tndb.UUCP>
Source record: 39503
Cross-posted to: comp.sys.amiga.hardware,comp.sys.atari.st.tech

I've been using floppies for long enough that every now and then
I have some "long term" data. If you keep track of the 'atari.st'
groups, you may recall my last report. I don't keep copies around
though, so I can't repost any. In this case these were 3 1/2" floppies
used Double Sided 720K on an Atari ST. The recording technology being
the same though, this information will of course apply directly to
Amigas as well.

A couple of days ago I checked out a box of about 16 disks that were
last used around 1986-1987 (my backups are dated) and found that 4 had lost
data. 3 of these were "white box" disks and one sort of expects them
to perform on the worse end. One was a certified DSDD Dysan disk which
from the looks of it, and from what I could remember, was essentially a
fresh disk. It was only used for backups and if I remember correctly
had just been used a few times -- probably recorded less than a half
dozen times, so that the surface should have been "fresh". This is about
as bad as it gets, short of being unformattable.

I also checked 8 5.25" disks from about the same period. Most of
these were heavily used, and in most cases they were "single sided"
disks used double sided w/720K per disk (yes, I use 80 track double
sided 5.25" drives on my old Radio Shack Color Computers). In this batch,
none of them had gone bad. That sort of surprised me. Then again,
most were Nashua's and I have found Nashua's are excellent disks.

As I've mentioned before, anyone keeping data long-term would be
well advised to re-format and re-backup important information, EVERY
year or for less important information, every 2 or 3 years. Leaving
disks for 5 years and over is *very* risky.

Do you have the program `ident' (which comes with RCS [revision control system],
for instance)? If so, try an "ident ksh.ttp"; this will print the mntlib PL
the binary has been linked with, for instance:
$Patchlevel: MiNT library: 30 $

In a previous article, andrew@minster.york.ac.uk () says:

>Does anyone know of a PD program to allow my 286 PC to read Atari, probably
>TOS1.0 formatted disks?
>
>-Andrew

All you have to do is use the WRITE MS-DOS BOOT SECTOR option in
DCFORMAT or DIAMONDFORMAT and your PC can read any ATARI floppy!

>I think 57600bps will never be able on a normal telephone line!

>Knarf

Will someone tell me the difference between baud and bits/sec.?

All I know for certain is that they are different and that 300 baud is
~300 bps.

How does one calculate the baud and bps rates?

adTHANKSvance,
Kenneth Love

1907. Anyone seen good "reasonable' zmodem sources?

Newsgroup: comp.sys.atari.st.tech

From: wilsont@rahul.net
Message-ID: <C4vyMB.5t5@rahul.net>
Source record: 39505

After trying unsuccesfully trying to wade through the zmodem.doc and zsrc15. sources, I was wondering if any of you knew where I could find some?

archie of course gives me 100's of locations, alot with the same junk.

Books, sources, a better Zmodem doc, anything... please tell me about it. thanks!

also, I just got grzsz.lzh from AA, and it works with multi-tos fine, but it has that wretched window that pops up. Kind of annoying, any better "quiet" versions?

Thank you!!!!

| well advised to re-format and re-backup important information, EVERY
| year or for less important information, every 2 or 3 years. Leaving
| disks for 5 years and over is *very* risky.

Nothing personal, Jim, but your statement (above) is utter bullshit.

I have Amiga 3-1/2" floppies from mid-1985 that are still 100% readable.
Not one has failed (and, as many have seen here at my home, I have over
4000 (yes, four thousand) Amiga floppies). All my Amigas have either 2
or 3 floppy drives and I just don't have any problems. AND I'm a heavy
smoker. Dust, dead spiders in the computers, etc. and still no problems.

I have 5-1/4" disks from the real early 1980's that are still in perfect
shape (and are still used quite regularly, on UNIX, C64, and other machines).
Yes, I still use my C64 (though mostly for EPROM burning nowadays).

And I even have 8" floppies (from late 1978) which are still used to boot
two of my remaining VAX 11-780 boxes. No errors yet after 15 years.

I'd be more concerned about the longevity of boot EPROM data; the expected
lifetime of THOSE is only 10 years and I dump all systems' EPROM code to
floppy for archival storage.

Hi Steve,
>The Overscan available on atari.archive.umich.edu (and elsewhere, including
>commercially), will NOT work on any machines above the STFM!
>(Or Mega-ST).
>It will not (apparently) work on TOS versions newer, or older, than 1.2
>(1.02), or 1.4 (1.04).
Overscan does not depend on the TOS version. I'm using Autoswitch Overscan
(the commercial version) on a MEGA ST (NO E!) with TOS 2.06 without any
problems (to be honest, there is one problem: My monitor can only display
672 x 480 pixels).

Let's get it right: There are three versions of overscan: the pd version,
the commercial versions called AutoSwitch OverScan (AOS) and OverScan TT.
None of these works on a STE or MEGA STE. OverScan TT is the only version
which works on a TT.

>If you have an STE, Mega-STE, TT, Falcon, you can forget about this
>overscan. (The Falcon has overscan, so you don't really need it anyway).
This is incorrect, too. There's a speical version of overscan called "overscan
TT" which works on the TT and increases the screen by ~ 50%. This version
is sold by Overscan for ~ 350 DM.
The latest produkt by Overscan is called "Screenblaster" and works only on
the Falcon. It offers up to 800 x 600 pixel in 256 colours with 87 Hz....

S>what is Mag!X ? And what are it's capabilities?

Mag!X is a TOS extension from Germany, which allows cooperative multitasking with GEM programs. This came _before_ MultiTOS, so maybe some people will think it's obsolescent nowadays (although I wouldn't agree with that, MTOS is far too big for those older/smaller STs).

Sorry, but I don't know any more details, since I don't have it. (Oh, well, I know about the price, which is about 100$ for the german version.)

I still use UniTerm, and I' also use Windows on a PC a lot. I can't find a program for that platform that's as good for Vax communication as the Uniterm is on the ST (of course I can't find a program for anything on Windows that's as good as the ST...). You can pay a lot of money for something comparable in the US--but nothing low end on the PC compares, and nothing on the ST compares when you need to run the ST as a Vax terminal that is, which is what I do most of the time.

E>>OS-9 is a Realtime Multitasking Operating System therefore it has to
E>>be very fast while multitasking. But the visualisation is done using
E>>the graphical extensions named before. This does not mean that a
E>>normal 68000 system would be fast but it would run, tough.

E>demonstrated here is the classic misconception about real time
E>operating systems. A "real time" os does not have to run fast. it
E>just has to run *predictably*. a RTOS will include in its
E>specification how long it takes to do various things like interupt
E>latency, scheduler overhead and different os calls.

Sorry, but you are wrong! My company is capable of selling systems
including a wide range from 68000 to 68040 CPUs. Nobody of our customers
is currently buying a 68000 system because of the big delays from
recognizing the interrupt to calling the appropriate interrupt service
routine (a simple DIVU blocks the CPU for over 100 clock cycles). Also
the more interrupts you want to control the less time you want to be
used for the various interrupt service routines. But less time means that
the CPU must execute the instructions faster.

You are right that a RTOS has documented specifications.

E>Once you have this information, you can design a real time system (i.e.
E>a system where getting an answer late is the same as getting an answer
E>wrong).

And a slow system would never get more than a heavy delayed interrupt
signal causing this system not to reach normal RTOS specifications.

E>I usually sum up the difference between fast and real-time as "quick as
E>a bunny" vrs "predictable".

Not versus, both are wanted! I prefer "quick bunnies" that have
"predictable" reaction timings.

E>If you look at os-9 using the above definition of a RTOS, you will find
E>out that os-9 isn't a fully documented RTOS because it is missing its
E>execution time specification.

That's totally wrong! Ask Microware for details about the execution time
for various CPUs but don't write about things you don't know. Every OS
system call, process scheduling times and the interrupt delay timings
before reaching the interrupt service routine have been measured and are
available from Microware distributors.

The reason why overscan doesn't work on STE/Mega STE is that the DE (Display Enable) signal that controls the borders are created and processed within one single chip, which makes it next to impossible to modify. In the old ST the DE signal is created by the GLUE-chip (if memory serves me) and then fed into the SHIFTER-chip. The overscan-mod works by providing the SHIFTER with another signal than that from the GLUE and by patching TOS so that it understands the new screen-format. Until recently (when the TEC was released) there has never been any demand for a version of overscan for TOS-versions other than 1.2 and 1.4.

I also routinely restore files from backups made in 1985-1987. The disks are mostly either Brown Disk or Memorex brands. Interestingly, almost all of them I got for free when they were rejected by a disk formatter where I used to work which was tuned to be ultra-sensitive to disk problems. (The disks from that place are used in 747 and 757 autopilots, that's why the formatting machine was ultra-picky.)

Sometimes my 1040ST (1986 vintage) fails to read such old disks. But then, lately it has been failing to read new disks with increasing frequency. The drives in the Falcon and MSDOS machines read the 1986 disks without any trouble, though.

state?

1918. Linux port to Atari ST -- Is anyone doing one?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-03 23:33:42 UTC
From: rdo@kynes.bison.mb.ca
Message-ID: <H.ea.S3Z9eBmICag@kynes.bison.mb.ca>
Source record: 39518

Anyone working on porting Linux to the Atari ST? Linux, in case you don't know, is a freely available UNIX port for the IBM PC.

I've had a chance to use this for a bit on a formerly DOS-infected computer. It's very FAST, and has an incredible number of people porting almost every remotely useful UNIX application to it! C-news, uucp, X-windows, fax, a pile of news-readers & mail-readers, tcp/ip, slip, ALL the GNU software, etc., etc.

Comparing MiNT/MultiTOS to Linux,

<-> MiNT appears to have been built on top of TOS (and inherits many of TOS's problems).

<+> Linux runs on it's own. You never even boot DOS! It's a fresh start, with none of the old DOS problems (e.g. 640k memory limit, etc., etc.).

There is a real opportunity here to breathe some fresh life into the Atari line up. Take a look at comp.os.linux. The traffic is extremely high!

With the obvious hardware advantages the Atari has over the IBM, an Atari Linux port would be an extremely powerful beast.

BTW, a port to the Am*ga is already underway. We'd better catch up, eh?

I've tried out the demo for Pure Pascal and really enjoyed using it!
However, with the documentation, as well as the help files, in German I
would have some trouble. Is there any other manual or Pascal book I could
buy that would give me information on how to use the ST-specific features
(eg. GEM/VDI)?

Thanks.

Yes, this does work well, but to me it is far too small and looks very poor. In many cases I had trouble distinguishing similar characters from one another. It also takes up less than the full screen area because of the font size used. So for me Connect is unusable on a 640x400 screen. However it is extremely well done, and is IMO by far the best windowed terminal program on the ST. It is one of only three term programs I have tested that has correct and/or adequate vt100 emulation: Flash 1.6, Uniterm 2.0e, and Connect. I have tried just about all others (never seen Interlink though, but that's about the only one I haven't tried).

It's not the modem setup, it is definitely using RTS/CTS. As I said, the handshaking seems to be there, it does have a noticeable effect, but it still drops the odd character. I use a simple test - log on to a Unix system, go to a directory with a LOT of files, say 500. Then do a "ls -l". This fails on my STe with Flash 2 - it runs along for a while, but eventually drops chars. BTW, if I load the patch prog TURBOCTS 1.32, this fixes it 100%. However, if I load TURBOCTS within Flash 2.1, it crashes. It also crashes in many other places, in addition to its bugs.

>With the obvious hardware advantages the Atari has over the IBM, an
>Atari Linux port would be an extremely powerful beast.

The Atari vs. _the_ IBM? There are many flavors of each (especially
if you include PCompatibles...), and just as Linux won't run on 286 or
lower PC's, it couldn't run (with all the goodies, at least) on lower
end ST's, it would require a TT or Falcon to be very worthwhile (for
speed, memory, graphics, networking and protection/paging reasons). A PC
that runs Linux well has quite a bit more muscle than an ST. (Don't get
me wrong, I hate PC's too :-)

I don't particularly see any advantage to porting Linux as opposed to
something neater like Mach. I've always seen Linux as Unix for the PC's.
(Mach is a slightly better idea for something to port, it's big claim
is that the Hurd will sit on top of it...)

Anyway, enough of my discouragement. Port it, the more the merrier :-)

Faster. 8) Seriously, it replaces lots more than W9 does, and generally comes out much better. It also includes GDOS buit in (with similar speed characteristics 8). It also works just fine with MiNT and Toswin. (and gives quite bearable screen speed with two or three windows running with Gdos fonts in them)

l> and MultiTos usable with every MultiTOS release.

[more about rewriting Uniterm]

Personally, I wouldn't bother. Everything that Uniterm does, CoNnect does
better, with perhaps the single exception of running fullscreen - and given
that you can do 80x25 in a window with CoNnect, that's hardly an issue
anyway.

Not to mention that, providing you don't let the MiNT dist. kit rename your
/dev/ serial devices 8) it works _flawlessly_ under MiNT and MTos...

Agreed - if not, you make yourself look pretty silly 8)

m> The technique generally used (certainly in Unix-style schedulers) is to
m> prioritise I/O-bound processes over CPU-bound processes.

Yup, however in a single-user environment like the ST, there's only likely to be one user-bound process at a time - and that's only likely to want CPU time at rare intervals. However, it needs very quick _response_ time...

m> This makes for good interactive response because I/O bound processes are
m> generally those that are interactive. They get most of the CPU time and
m> soon become CPU-bound, so their priority falls.

Again, on a multiuser system that is likely to be the case. Prioritizing I/O bound processes on a single-user system is likely to lead to things like database reindexes, compiles, spellchecks and the like monopolising the system, and degrading its response time to an unacceptavble point.

m> My general point is that scheduling theory is more complicated and
m> subtle than you might imagine.

Oh, I know, I know 8)

Well I have the Mono only version of Script 1, sold by Magamax,
is there a way I can update to the a English version of Script 3..??

Or has Magamax closed down..??

I have just had a look at Script 3 demo, it now runs in medium resolution..

I think this would be the best Word Processer for the Atari, I have found
it easy to use and with all the font options this takes a lot of beating,
The output looks very nice on my cheap HP. Deskjet.

I did here that the Megamax version did not sell to well in the USA,
was this because it was Mono only..??

May be Megamax should have another look, as that is no longer a problem,
thats if they are still around..

What other stuff from Application Systems did Megamax sell..??

Roger.............. sheppard_r@kosmos.wcc.govt.nz

The biggest problem here is the appletalk protocol - it sucks completely.

I spent a day or two (and a catering pack of barf bags) browsing the
relevant Inside Macintosh volume, and came away thinking that regardless of
how popular it may be, I wouldn't want to embark on it without the help of a
number of experienced Mac networking gurus.

Now, maybe I'm just a total loser - so if anyone else out there has anything
to say on the subject I'd love to hear it...

|state?

Sorry, I don't have the answer (re: GALs). While we're at it, *what* are
"GALs"? (I presume you're referring to some type of semiconductor memory! :-)

I am familiar with PALs and ROMs, etc. and no databooks I have suggest that
we'll be needing to worry about those during our lifetimes.

The information about EPROM lifetime was taken from Intel (and other) data
books (re: charge depletion).

And with any luck, the Falcon won't be too far behind the Hurd in
release dates either. ;-). Seriously though, there's a project under way
in the Amiga community to port linux. Someone commented that it's pretty
hairy because the kernal code is very Intel specific, and doen't port
easily. I'd think tweaking MiNT's kernal, if there's any room left to
speed it up, and trying to make it more posix compatable, would give
you better results.
It's still not going to work worth a darn on anything less
than an 030, and even a Falcon might be a bit sluggish, maybe slightly
faster than linus on a 386zsx.

Ahem. It is not "bullshit". Mind your manners. :-)

>I have Amiga 3-1/2" floppies from mid-1985 that are still 100% readable.
>Not one has failed (and, as many have seen here at my home, I have over
^^^^^^^^^^^^^^^^^^

Now *that* is hard to believe. Especially since I know that
I'm certainly not the only person to have failures right-out-of-the-box
occasionally, even today. If you know your statistics, you have to believe
that if even 1 out of 10,000 disks is unformattable right out of the box,
then assuming a bell-curve, more than that will be "marginal" and will
be unreliable (lose data over a "short" period), and some of these will
eventually go unformattable over time. And this is exactly what my
experience has been, and it has been similar to what other people whose
reports I trust have said. As for your report, I "note" it, but I
don't give it much weight because when I look at what you're saying,
you're experience is "ambiguous". Look at my next comment.

>4000 (yes, four thousand) Amiga floppies). All my Amigas have either 2
>or 3 floppy drives and I just don't have any problems. AND I'm a heavy

Actually, that may just mean that the individual floppy disks, and
drive unit don't get hard use. That's possible. I know that Bruce
Tonkin had to replace floppy drives (5.25") after about a year of service
each. He actually *did* use drives that hard (as a professional duplicator).
Then again, I never had problems with Shugarts/Panasonics, but Tandons were
a waste of time. I never got a Tandon that worked within spec. That may
have been "luck of the draw," but brands matter. And floppy disks likewise
wear out more if you use them more. That's why your report doesn't mean
much.

...

>I'd be more concerned about the longevity of boot EPROM data; the expected
>lifetime of THOSE is only 10 years and I dump all systems' EPROM code to
>floppy for archival storage.

Well, the "official" expected lifetime of floppies back in the
'80s was only 5 years (which is why I expected the failure rate I got).
So what you're doing would look backwards, but the real key is to have
many and *varied* backups, and to re-backup regularly. As for your
experiences with 5.25" and 8" floppies, well, yes, I've got a few years
under my belt with those too, and I know people with probably more than
you (actual hours of disk usage that is). But the 1985 - 90 period
for 3.5" floppies was a particularly bad one. I've noticed a definite
improvement since then, and I certainly *never* had the problems with
5.25" and 8" technology that I had over the same years. On the other
hand, the early years of 5.25" were spotty too, but by around 1987 they
were so good that I was using "white box" disks fairly regularly. Even
still, as late as 1987 - 1989 I can remember buying 5.25", especially from
BASF which were so badly warped that the heads would float and not be able
to format them.

But I've digressing a fair bit. The point is that reliability
experience with 5.25" and 8" disks from after '85 doesn't translate that
well to the 3.5" of the same period. So I can't say that what you have
said *so far* means that much. Again, to summarize, you seem to have
a lot of floppy disks for your Amigas, but it doesn't sound like you use
them much. Also, have you even gone through your '85 - '87 disks to see
if they are intact? I hope you take the time to check a few random samples
(say about 20 disk) and report back. I'll look forward to it.

Also, it sounds like you'd be doing us a favour if you pointed out
what brand of floppies you're using. I can say that since around 1990
I've been using mainly Kao disks and I can't recall a bad Kao disk
out-of-the-box so far. From 85-90 I was using mainly Dysan, Fuji, Sony
and Precision "brand names" but also maybe about 20% "white box". As my
latest report points out, the "white box" disks from that period seem to
have turned out a disaster. And I've replaced 2 drive units, now that I
think about it. Slight differences in drives (speed, "wobble" and head
alignment) might be adding slightly to the read failures.

I think that if I were using MiNT all the time, I'd probably either use
Terradesk instead of Gemini (and have TOSWIN loaded), simply because
it's smaller. When a newer MiNT/MultiTOS-aware Gemini is released,
it'll be much nicer.

Oh yah, and Steve Sowerby (that might be spelled wrong, sorry Steve!) is
working on a nice (and I do mean _nice_) MiNT/MultiTOS desktop
replacement. It just went into its first beta a little while ago...
Handles weird filesystems, does file operations in the background, etc,
etc...

I've seen alot of people mention that they do their programming under MiNT. I realize the advantages this could have - unix compatibility, multitasking/threading, and so on - but I have a question...

Is it horrendously slow?

Better phrased: The software I've been working on is huge. It's well over 500K of source in over 100 files. Under TOS, using bammi's version of make and version 2.31 of gcc, a full recompile takes approximately 2 hours. Under MiNT, would it be even slower? Do I need a faster machine (I do anyway)?

1938. Falcon resolutions/colors...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-04 19:30:45 UTC
From: jared@midiline.la.ca.us
Message-ID: <yPyH2B1w165w@midiline.la.ca.us>
Source record: 39526

In all documentation (i.e. articles and newsbits), the Falcon is quoted as having a dozen or so resolutions, but none of them go beyond 640x480. True color is fine, but what if we Atarians want 1024x768 in 65,000 colors? What then? And is the Falcon capable of 24-bit video? If i'm not mistaken, you need 1Mb of RAM (at least) and 16.7 million colors.

Can someone give me some REAL detailed specs on the Falcon? Is it or is it not a 32-bit computer? Does it or does it not have a 32-bit address bus? Does it or does it not have 24-bit video (and resolutions above 640x480) capabilities? And why, o WHY did they put the silly thing in a case that was outdated after the last 1040ST's rolled off the line? I say they should've taken the MEGA ST case and made that the new style for the TT and Falcon...

What is this little bird REALLY capable of doing? Or are we going to see it go into a dying swoop along with the weak software market for the Atari ST? Where is US support? Seems everything nowadays is made in Europe or England, or Canada, and it's "imported" and "distributed" by US companies that COULD be making their own software instead of just licensing it or whatever. BTW, I happen to be writing this little note of my Mega ST2, so I must like the Atari somewhere...

Note: Over an Apple //c, 286-16, Amiga 500, and 386DX-33, I've stayed with (and always come back to) the Atari ST series. What is it about them that keeps me coming back? Hmm... must be GEM and TOS (grin).

Jared

The harddisk driver is responsible for that. The question is: will
ICD's driver support normal floppies (== media without root sector).
I'm not sure (our driver -- HuSHI -- does it, but I doubt that it is
available in the US).

From: stusoft@hardy.u.washington.edu
Message-ID: <1po58qINNoqk@shelley.u.washington.edu>
Source record: 39528

I was doing a hex read of a gif file that I was unable to view using standard GIF viewers, and I noticed a word in the header...GIFLITE.

I think this is some different type if GIF87a format, and I really need some code or description on how to decode this format. If anyone has any info, please write. I know GEM View can decompress this format. Does anyone know, or can anyone contact Dieter Fiebelkorn, the author, to see if I could get info on it from him. I'm really desparate. No one from comp.graphics seems to write me back.

Thanks for any help given!!!

> libraries around that handle all this stuff, but I really want to understand
> how this can be done.

Others have explained the technique of using objc_draw() for drawing
the contents of a window, and writing your own form_do() to handle
clicks. The only truly modal component of GEM forms is the edit
cursor - since it is state apart from the OBJECTs in the form.

I have done this for the GEMformwindow class in my GEM++ library, which
is a GNU C++ class library for writing GEM applications. My solution
to the edit cursor problem was to use a "click-to-type" approach - the
window initially has no cursor, and the user clicks in an editable
field to type, then types input, and presses return to end the input.
I also check for clicks and end the input if those happen. It works
very well.

As soon as I find a G++ 2.3.3 for the ST, I'll upload GEM++ (G++ 2.3.1 has
some bugs).

From: warwick@cs.uq.oz.au
Message-ID: <12801@uqcspe.cs.uq.oz.au>
Source record: 39529

Does ANYONE have binaries for GNU C++ 2.3.3? I am using 2.3.1 and it
has some VERY annoying bugs in it. These bugs have been fixed in 2.3.3
(according to the ChangeLog).

Unfortunately, I don't have enough diskspace on the Sparc to recompile
it, and nowhere near enough CPU at home (but plenty of diskspace).

MiNT or TOS version is fine (MiNT makes no difference).

Beware that a G++ that was filed as "G++233" on a.a in the disrib kit
recently turned out to be version 2.2.2! Gads, even OLDER than the
TOS version!

Hehe... are they sueing the X Window System too? That's the system with
iconification that I'm familiar with (for those that don't know, iconification
is when you turn the window into a small icon, which may then be clicked on
the return the original large window. It's great for saving screen-space
in multitasking environments).

>> Currently, I just use the "FULLER". Okay, it's confusing, but I don't

>fuller icon to iconize the window... Click on the fuller won't do
>anything (since this app won't want to take up all that much screen
>space).

Ah, I hadn't considered alt-clicks. Maybe the CLOSER could Iconify while
ALT-CLOSER could Quit (since quit is a dangerous operation).

The main problem is that of consistency with existing applications, that's
why I suggest we think of a standard solution.

> pppplease ... can someone help us ...??? :^)
>
>Seba.

I seem to remember hearing of such problems before (not only for STs
but for PCs too). They were due to the refresh that is not quite the
same on the 4Mbits chips: there is twice more rows to refresh (1024
intead of 512) on the 4Mbits chips than on the 1Mbits and this
additional bit was not used by the refresh mechanism. This explanation
was for a PC. As far as I know, the ST doesn't really need to refresh
its memory because the scanning done by the video circuitry has the
same effect, but maybe the scanning is not 'exhaustive' !

If that's the problem, ... you'd better find 8-chips SIMMS !
(there has to be another solution, but it is unlikely to be trivial)

>Hmm, I never have any problems with mouse or keyboard response times -

>whilst I think that a few improvements could be made there, it's not a major
>problem.

The main problem MiNT and hence MultiTOS has is that it relies upon the hard disk driver below it for disk access. This means that EVERY time the disk is accessed the whole machine goes to sleep! What is needed is for the disk driver to be integrated with MiNT in such a way that all disk accessing is asynchronous and interrupt driven. In this way, any process requiring disk access will have to wait, but the rest of the machine can carry on with whatever it wants to do. I'm sure this is the major reason for the perceived slow down.

I don't know the difference for sure, but I've heard once that bps was what you would expect whereas bauds denotes the frequency of the electrical signal going on the phone line.

For example, I seem to remember that at 2400bps, bits are not only coded by different frequencies but also different amplitudes so that 2400bps was actually 1200bauds.

All this is highly not sure... any body has better info ?

1949. Re: SIMMs memory upgrade question ...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-05 09:29:20 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Apr5.092920.25859@tdb.uu.se>
Source record: 39537

It could also just be a normal PSU-problem. The PSU supplied with most STs and STEs aren't powerful enough. In some cases it's so close that a memory-upgrade will cause the computer to crash. Believe me, I've got first-hand experience! My problem was that I had a STE with 2 meg RAM and a T16 card. When I popped in the two extra simms to get 4 meg the computer stopped working in 16 MHz. I tried a whole bunch of different simms since my friend sells simms for a living (almost :-). Finally I tried switching the PSU after a tip from a guy at the nowadays closed-down Atari Scandinavia. Voila, it worked! The only valid explanation must be that the extra power needed when running at 16 MHz (I'm told that the processor wastes 4 times as much effect if the clock is doubled) was too much to carry for the PSU if all four simm-slots was occupied too.

BTW, the symptom when booting the computer with 4 meg and 16 MHz was that the screen would start to flicker heavily and also leave some crap just as if the memory wasn't refreshed properly. However, this only happened if the screen-memory was located in the upper 2 meg of memory. Also, the computer actually booted and started GEM properly in most cases and I could run a couple of programs (if I could see what I was doing :-) before it crashed. Aparently the refresh didn't work in the lower 2 meg bank either.

Now I own a MSTE 4/85 which refuses to be upgraded to a HD-floppy. If I connect an external SF314 the internal 1.44-megger works just fine, but the SF314 won't work at all. With no external drive I can only read from the internal, every write is unsuccessful. Isn't life funny? ;-)

I wonder what strange symptoms I will get with the Falcon I'm about to buy.

Could have fooled me; I'm using a high density drive on TOS 1.4 and it
works fine. You just have to set the seek rate to 6ms, and there are
loads of PD programs to do that, although I use the NeoDesk control
panel. You also have to take a higher rate clock into the drive
somewhere; I'm not entirely sure of where though. I _think_ there's a
text file detailin the mod somewhere on an archive site... (not very
helpful, I know... :))

Oh well, I had some problems using floppys too. But the strange thing was that almost new Maxell floppys gave me the most problems. I heard that this is caused by the luxureous amount of fibers that coat the inside of the floppy. That makes it sometimes too hard to spin the disk at a high enough speed.
Anyway, after having used my floppy-drive for 7 or 8 years, 9 out of 10 3M disks that originate from these very early beginnings (I payed more than $50 a box for these back then) still work perfectly. And now I used a cleaner on my drive I hardly get any disk errors any more. Especially when I set the drive seek to verify. So I was worried about the reliability of floppies, but most floppies will last for a very long time.

>stupid.

Oh, maybe, I don't really care. But I think I have come up with a solution to the problem that Ian Lepore described with having the entire 14 meg populated with dual ported Video RAM. If 14 Meg is too expensive for most people, and programs still expect that they can place physbase anywhere in memory, maybe it is a good idea to make all of the ST memory dual ported video RAM. Then only programs that use Fastram would be affected by this, and programs that use FastRAM are mostly professional applications and these usually do not do something that seems te me to be very MultiTOS unfriendly, like changing physbase. That would cause the need for 4 meg of dual ported vram in current atari models. And after hearing a bit about current prices, it might very well be possible to include such an amount of memory. That way there is no need for atari to provide us with yet another guideline for programs, because this would be totally transparent to all programs. It could be included easily in future Falcon models. And we are still able to upgrade to 14 meg if we can afford to buy 14 meg of dual ported ram. Need cheap ram? Add some fast ram. If we do not do something like Ian suggested (2 Meg basepage of dualported vram) and the rest normal ram, we are even ready for future versions of graphics processors that use more memory because they use e.g. 24 bit for color. Hmmm my fantasy is carrying me away a bit. But if this is a feasible option, maybe someone should ask Atari to consider this in future computers. (I am sure they already did consider this, but thought we wouldn't appreciate the benefits it brings, compared to the price we pay for it, after all the current Falcon does not suffer very very much from the video display, except perhaps in some screenblaster modes.)

Erlend.

Yes, it works with additional programs. For TOS 2.06 you don't need them any
more. Additionally the TOS 2.06 desktop allows to format HD disks, the TOS
1.04 desktop doesn't. Of course you can take other programs to format HD
disks.

Date: 1993-04-05 13:31:41 UTC
From: Chris.Forker@newcastle.ac.uk
Message-ID: <C50Iwt.Axr@newcastle.ac.uk>
Source record: 39395

Does anyone have any information on Pure C++. I was told by a friend that it was at final Beta test in March, with a release date sometime in April.

Do any of our German netters have any information on this product.

I would appreciate a technical description of what the product consists of ie. Incremental compiler, linker, class browser, graphical debugger tool etc.

Thanks in advance

- Chris

dear friend class Person x,

We would like to know C++ on the ST/TT is so rarely used. Are there any programmers out there who have successfully written a GEM application using GNU (or any other) C++. Are there any hidden traps we should watch out for? Or is it just that a simple hello.cc generates at least 58K of code with ALL optimisation and symbol stripping flags on [of course, using the C++ style cout stuff] ?

Are there any users of the GEM++ library except for Warwick and his class [sorry, Warwick] ?

isLong(sizeof(our appreciation))

|> One can't. The AES does this automatically for windows that have arrows and
|> scroll bars, and does nothing for windows that don't.

I tried out earlier advice, and indeed scroll bars will cause the AES to force a minimum window size on drag-sizing. The arrows are not needed. I just used a value of 1000 for the drag box size, which covers the entire scroll area and so scrolling is not possible (I didn't check to see if messages were generated when the scroll bars were manipulated -- they are obviously still active, as you get a scroll outline when you click down on them, but they can't actually be moved).

The AES does not enforce this minimum in sizing requests from the application, and so an application can still use wind_set to force the window to be (ridiculously) small.

Thanks for advice from all . . .

Cheers,

Brad

1958. Re: Linux port to Atari ST -- Is anyone doing one?

Newsgroup: comp.sys.atari.st.tech

Source record: 39398

Linux is being ported more generally to a 68xxx based enviroment, that doesn't just mean Amigas, it also means macs and ST's. However it is only being ported for 68030 and upwards, because the lesser 68xxx based processor have no memory protection (that might be 68020 and lower I can't remember). Hence only TT's and Falcons are going to be supported unless someone does try and write some MP stuff for 000, 010's and 020's...stable...I think not!

There is a Linux 68000 mailing list that informs you of the current status of the project, though I can't remmber the address off hand.

>For example, I seem to remember that at 2400bps, bits are not only
>coded by different frequencies but also different amplitudes so that
>2400bps was actually 1200bauds.

>All this is highly not sure... any body has better info ?

Well, I'm not sure either but since I didn't see any other followup
(yet) I'll give it a try. I think the baud rate shows the 'real'
number of binary digits sent over the line, whereas the 'bps', bits
per second rate shows the number off 'useful' bits, since the modem
protocols add extra stop bits and such. If I remember correctly, most
modems send 10 bits for every byte (one of which is a stop bit), so a
baud rate of 2400 would actually have about 1920 bps.

PS. Hmmm, that last figure sounds familiar, but where I know it from
has nothing to do with modeming. It's the max. number of horizontal
dots an A4 9-needle matrix printer can do in quadruple density :-)

Hi,

I'm currently writing a game and I would love to include some samples that
I've made into the game. Can anyone tell me how to go about doing this?
I'm using Ian Lepore's Heat n' Serve Sozobon C v1.4 (GemFast v1.8) and a
520 STFM (TOS 1.62) upgraded to 2 Megs.

Any help greatly appreciated,
Grant.

>>TOS 1.6, or does it fit in my rom-sockets?
>
>You need TOS 2.06 and for that you need an extension board.

Wrong! You don't need TOS 2.06 to use HD-disks. TOS 1.04 is also able to
manage reading from and writing to HD-disks, but you need TOS 2.06 to _format_
HD-disks from the desktop. But with TOS 1.04 you can format them with most
of the actual copy- and format-programs available, so there should be no
problem.

Ciao,
Oliver

1962. Falcon Speed and monitors

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-05 16:08:42 UTC
From: hubert@swi.psy.uva.nl
Message-ID: <C50q6I.2wo@swi.psy.uva.nl>
Source record: 39402

Does anybody know if Falcon Speed, the PC emulator for Falcon 030, support the VGA monitor in color, cos I thought I read it could only have VGA in monochrome and that sucks. If it doesn't support color VGA, is there another emulator or upgrade of FS coming out, that will support color VGA (or better: color SVGA)?

thanks

Herry

There is a very good program available in the UK called HP_CHROME which creates HP std, plus, 500, 500C and 550C output formats. It comes as a PD version available from most PD sources and also as a full blown package for a small fee.
It takes DGAS or NEO files and produces fair results.

Ok, here we go, straight from my Networks class earlier this semester:

Data rate VS Modulation Rate

Data rate: The # of bits transmitted per second (bps)

Modulation rate: The # of signal changes transmitted per second (baud)

Historically: modems transmitted one bit signal change and thus the data rate equalled the modulation rate.

Today: with 2^n distinct signal values, each signal represnets n bits, Data rate = n * (modulation rate)

INCONSISTANCY: many modems are described incorrectly. A "9600 baud" modem is really a "9600 bps" modem! It is really a 2400 baud modem, assuming 16 unique signal levels.

I would also check the Specifications for CCITT V series interfaces which indicate the different V.xx numbers, their bps and corresponding Baud rate.

I will let you chew on that for a while until someone else tries to explain it better.

At first thanks for the replies.
As I don't want to spend too much money on my Atari, I don't feel like getting myself a TOS 2.06. I don't have any money at all, and I can get a TOS 1.4 for free (on Eproms). All the rest I already have... Besides, if I do have any money to spend (hopefully this summer), I'll buy a Falcon 030. So the only thing I will change on my ST is another TOS and memory upgrade (cos I got the simms for free as well :)
Thanks alot for the info

I'm very much looking for script III as well, but I doubt whether it's
released yet.

>I have just had a look at Script 3 demo, it now runs in medium resolution..

Script 2.1, which I use, also works in medium resolution, but I prefer to use
it in mono, cos that looks much better. The only way to get a true WYSIWYG.
Script 2.1 already has a lot of new features, which I knew already from MS word
4.0 on a Mac, which makes it the best word processor I've ever seen on an Atari
and believe me, I've seen a lot. :)

>I think this would be the best Word Processer for the Atari, I have found
>it easy to use and with all the font options this takes a lot of beating,
>The output looks very nice on my cheap HP. Deskjet.

You're right. Script makes 1st word+ look like shit, and even That's write
ls

looks kinda fragile compared to it.

>need a faster machine (I do anyway)?

Yes, MiNT will make your system slower. Not a great deal slower though,
particularly if you're still using your system the exact same way as before,
i.e., running a single shell, a single make, a single compile procedure, etc.
If you try to start a bunch of additional processes in parallel, things will
certainly slow down further; there's only so much CPU time available after all.

I suggest, while you consider buying a faster machine, you structure your code
dependencies such that you don't need to do a full recompile too often!

Source record: 39416
Cross-posted to: sci.electronics,comp.sys.atari.st.tech

Recently, my video monitor went dead, no picture, some low distorted sound. I didn't hear the tell-tale cracking that indicated HV at work, nor are the filaments at the far end of the tube glowing orange, just nothing.

On examining the power board, I noticed the largest capacitor with a very bad bulge at the top. Naturally, I want to replace it, but I can't find any sources.

The electrolytic capacitor is 330 mF at 250WV. It has radial leads, and is roughly 1 1/2 inches long, 1 1/8" wide. The dimensions are important since the whole board fits in a metal cage, leaving little room.

Living in the Los Angeles area, I've been to numerous stores (Dow Radio, All Electronics, ITC Elect, Sandy's, Yale Elect) with empty hands.

Can anyone suggest sources for high-voltage capacitors? Mail order is fine, although I'd rather check out a store to compare the can. I'm going to try a video electronics store, hopefully they'll have HV caps.

(By the way, the monitor is a ATARI SC1224, Goldstar circuitry, Masushita tube. Anyone else had problems?)

Thanks in advance,
Rich K.

Source record: 39423

Hi!

I have a 4-meg 1040STe and I am using the double.prg on a color monitor to get a 640x400 interlaced 4 color screen. Is there anyway to trick the system into thinking I am using a monochrome monitor or think it is ST-hi but in four colors? Some programs, take gemview for example, will use the extra room on screen but still think it is just a 640x400 medium resolution screen. As a result pictures are squashed vertically. I just want someway of having the system think the current screen resolution is 2 (640x400) and also still use the four available colors. Thanks very much!

GALs (Generic Array Logic, manufacturer: Lattice) are devices similar to PALs.
The differences are that GALs are erasable and reprogrammable (just like EPROMs)
and also they are much more versatile (1 type of GAL replaces (theoretically)
several types of PALs; theoretically because it's not always possible to replace
PALs with GALs due to their slightly different specifications). I don't have
any information handy right now to check the internals of GALs but I would
assume that their internal structure is similar to E2PROMs, at least in terms
of matrix information being stored in capacitors (-> charge depletion).

GIFLITE is a utility that can compress GIF pictures (which are already compressed) an average of 30% more than normal. It does this with varying loss of detail..

GIFLITE compressed pictures are still compatible with regular GIF files and viewers.. (I *have* had some problems viewing them with some ST GIF viewers though..), in contrast to the JPEG compression method which requires that the file be uncompressed before viewing.

I've used GIFLITE on my PC for quite a while now, and the 30%+ savings in disk space has been quite nice. The PC GIF viewers I use are completely compatible, and handle GIFLITE'd files just fine.

>GNU (or any other) C++. Are there any hidden traps we should watch out
>for? Or is it just that a simple hello.cc generates at least 58K of code
>with ALL optimisation and symbol stripping flags on [of course, using the
>C++ style cout stuff] ?

There are two more problems:

1) You need lots of memory. Not many ST users have 4Mb -- and i am afraid
that is on the small side for complex programs (based on VM stats running
g++ on a sparc.)
2) Reported compile times on the St are terrible -- having to wait 1 minute
for a iostream-based hello.cc is too long.

These two are my reasons not to use g++ on the ST. If somebody can confirm
that 4Mb really is enough for normal g++ program i might upgrade -- but i want
to be sure first.

1976. Help us with keyboard chip!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-06 10:59:22 UTC
From: pasha@isi.itfs.nsk.su
Message-ID: <AAAAMmhSJ4@isi.itfs.nsk.su>
Source record: 39426

We have a trouble with Atari MEGA ST keyboard.
We can not just call the firm because we live in Russia.
There is a chip inside, and everything goes as it
has been damaged. Its code name is HD6301V1P.
We can not get such a chip, so we need to know
as much as possible about it to replace it by
some equivalent. We know that 6301 is a single-chip
microcomputer with built-in ROM. We need a chip
description and the contents of its ROM if it is
available. Is it possible to get already programmed
one and where?
Or maybe anybody can supply us with description of
Atari Keyboard. What signals go from Atari to keyboard
and back? Is it compatible with PC keyboard?
Please, help us!

1977. Re: C= chooses RISC Chip for future amigas.!!!!

But give it a chance. The current one-off price of a 200MHz 21064-AA is around L1700 (US$2500), but that will drop sharply. Remember that the 68000 was a workstation processor when it first appeared - now it's barely enough for a games machine (A600, Sega and Nintendo all have extra hardware). I would expect to see the first Alpha machines used by serious home enthusiasts (the kind who have an A4000/Quadra/486DX now) by late 1994, probably in the form of PC replacements running Windows NT, or possibly Unix machines. DEC's biggest potential market is power PeeCee users, who would otherwise be after a 586 or Pentiwhatsit, and it is in Microsoft's interest not to be tied to Intel forever.

...

That's not it. The estimated "baud rate" is the number of
state changes per second. The *actual* baud rate might not cut
that for various reasons, but it's usually very close. The estimated
maximum "bps" or bits per second is usually very close to the baud
rate in serial transmission systems, though a "bps" rating for
an 8 bit parallel port would be 8 times the "baud rate" (assuming
a byte is transmitted per state change and all perfectly timed -- not
necessarily true). But again, the real "bps" is often not up to the
rated value for various reasons.

...

I disagree, which in this case is NOT the same as saying that
you're wrong. It's not inconsistent because "baud" refers to a
"state change" and a change in signal level can be considered a
"state change", so terminology can be considered properly used.

As far as I know there will be newer versions that support color SVGA
for all programs. At the moment however, there is only a Windows 3.1
driver that can use color SVGA.

Erlend.

>All this is highly not sure... any body has better info ?

Hmm.. From E&CE324 (Computer Structures) comes the following definition:

Baud - the number of SYMBOLS sent per second.
BPS - Bits per second.

For the slower modems, (<=2400, I think), Baud=bps (ie ONE signal per bit
is sent) which is why many people (incl. myself sometimes) get confused.

I don't remember exactly, but I think 9600 bps modems are really 2400 baud,
with each SYMBOL representing FOUR bits (4*2400 = 9600). In a similar manner,
14 400 would just be SIX bits per symbol (6*2400 = 14 400)..

How does one symbol represent 6 bits? Different frequency contents, phase
shift, etc.

For non-phone lines, you can do lots of other neat stuff. If you had a detector
on either end capable of distinguishing 256 levels of voltage in 1/1000 of a
second accurately, you could send 8 bits * 1000 baud = 8k/s...

I have a feeling E&CE411 Digital Communications (continuation to E&CE 318) will
probably also shed some more light on the subject..

1982. RESULT: comp.sys.atari.advocacy passes 170:36

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-06 16:33:18 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1psbceINNbdt@rodan.UU.NET>
Source record: 39424
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

Voting for the creation of new newsgroup comp.sys.atari.advocacy was closed on
1st April, 1993. The final result was:

Yes votes: 170
No votes: 36

Yes - No: 134 (must be over 100)
Ratio Yes/No: 82.5% (must be over 66.7%)

This proposal has passed its voting stage.

Please check your vote. If there are no significant irregularities or
objections reported after the 5-day consulting period, then the group will be
created.

Thankyou to all who voted, YES or NO!

David Oakley, proposer comp.sys.atari.advocacy

This is most amusing, all these people guessing at this question and all giving different answers! (And all totally wrong!) The baud rate denotes "symbols/sec", where the meaning of a symbol depends totally on the encoding scheme used to modulate a carrier by the modem. High-speed modems use VERY complicated encoding schemes to produce high bps (bits-per-second, pretty unambiguous) rates but still fairly low baud rates. The technique used in general is to produce more complex "symbols" that are sent over the phone line, although the number of symbols/sec is still quite low and can be transmitted in such a way as to not be mangled by the miserable electrical characteristics of phone lines. Many parameters can be adjusted in the encoding, including frequency, phase, amplitude, and probably some others... Most modems nowadays are rated in bps, the baud rating is quite irrelevant to the user, and is a holdover from the old days when bps and baud were quite similar.

Hi folks,

a couple of days ago I saw a posting here in c.s.a.st.tech that
was about the phenomenon of VGA monitors displaying a large,
unused area on the right side of the screen when hooked up to a
TT. Could someone mail that posting/these postings to me? I
didn't pay much attention to the thread when it was on, but now I
am offered a used VGA monitor unexpectedly, and I experience that
very phenomenon.

Greetinx & thanx in advance, Jan

>and that sucks. If it doesn't support color VGA, is there another emulator or
>upgrade of FS coming out, that will support color VGA (or better: color SVGA)?

It will support the 'standard' 640*480*256 VGA on the MS-DOS machine.
There is 486/33Mhz emulator in the works which will be quite capable
of this & more (although whether they'll use the extra graphics remains
to be seen).

Compo' should have finished it by now (they've had quite a while).

>
>>I think 57600bps will never be able on a normal telephone line!
>
>Will someone tell me the difference between baud and bits/sec.?

Sure. Most commercial modems today use a modulation format know as Phase Shift Keying, or PSK. In a binary PSK system one differentiates between a 1 and a 0 transmitted over a given time interval (Baud interval) by shifting the phase of a carrier signal by 180 degrees. If instead of 0 and 180 degrees you change the phase of the carrier by increments of 90 degrees, two bits can be transmitted in the same baud interval. So while the baud rate hasn't changed, the number of bits transmitted per baud interval has doubled. Using a combination of phase and amplitude changes, several bits can be transmitted in a single baud interval. This is known as Quadrature Amplitude Modulated Phase Shift Keying, or QAMPSK.

Note that not all of the transmitted bits are used to carry data. Some are used for complex error correction schemes, such as Trellis code modulation using the Viterbe algrorithm employed by V.32bis. This makes it often unclear how to calculate the bit rate based soley on the baud rate and the number of data bits transmitted per baud interval.

In a nutshell, Baud = number of symbols per second
bps = number of bits per second.

The theoretical limit of baud rates over 4KHz bandwidth phone lines is around 2500 baud, so anybody who claims he has a 9600 baud modem is using the wrong terminology.

>All I know for certain is that they are different and that 300 baud is
>~300 bps.

Yeah, generally 300 baud modems use Frequency Shift Keying (FSK), which generally only transmit one bit per baud interval, so baud and bps are both accurate in this intsance.
>
>How does one calculate the baud and bps rates?

bps = baud rate * 2^(number of bits per baud interval - 1)

Note again that some of the transmitted bits may be "redundancy bits"
used for error correction, rather than part of the transmitted data.

This stuff used to be simpler.

1988. Re: What's this darn GIFLITE format?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-06 23:27:58 UTC
From: au215@cleveland.Freenet.Edu
Message-ID: <1pt3lu$m9a@usenet.INS.CWRU.Edu>
Source record: 39437

In a previous article, stusoft@hardy.u.washington.edu (Stuart Denman) says:
+I was doing a hex read of a gif file that I was unable to view using
+standard GIF viewers, and I noticed a word in the header...GIFLITE.
+I think this is some different type if GIF87a format, and I really need
+some code or description on how to decode this format.

I've seen a couple of "GIFLITE" files, and I think they are created by some PC application. These files contained an extension block, as introduced in Compuserve's GIF89a format document. (Thus, any GIF file with an extension block should have a version number of GIF89a or later. Unfortunately, this does not always seem to be the case.)

When decoding, the only practical thing to do with extension blocks is to skip them. I posted a program ("FIXGIF") a while back to load a GIF file, strip the extension block, and save it again, which worked fine with those pesky GIFLITEs - at least, the ones I had.

Just as "," ($2c) introduces the image descriptor within the GIF file, "!" ($21) introduces an extension block (where you would have been expecting to find the comma). The next byte gives the type of extension block, e.g. comment ($fe), application ($ff), plain text ($01), graphics control ($f9). There then follows one or more series of <block size (byte), data block>. (The length of the data block is given by the preceding byte.) A block size of zero terminates the extension block, and if all is going to plan, the next byte will be either "," or "!".

So the 68000 assembly code would look a bit like this:

```
.start cmpi.b #'!',(a0)
bne.s .okay ; if no extension block, nothing to do
addq.l #2,a0 ; if so, we don't care what type it is
.loop clr.l d0
move.b (a0)+,d0 ; get block size into d0 and skip block size
tst.b d0 ; block size of zero?
beq.s .start ; if so, back to start to look for another
adda.l d0,a0 ; otherwise skip data block
bra.s .loop ; and prepare to skip another
.okay ....
```

Hope this helps,
Stephen

>Atari ... they're just stupid.

Come now, I think there are a LOT of people that are very glad Atari (and
Amiga) don't have a fixed-location screen. All these bigscreen emulators
with hardware scrolling, and almost every game takes advantage of the
excellent flexibility an arbitrary-location screen gives. Even the hardware
scrolling feature of MiNT (great for those with slow computers!) would not
be possible with fixed-location screen memory.

Atari computers aren't ONLY used for GEM applications! (Despite Ian L)
Atari computers aren't ONLY used for TTY applications! (Despite Chris H)

Fixed-location memory is fine for some applications, but arbitrary-location
gives flexibility.

You're using different OS levels. There is no warranty that the screen the VDI uses is the same one XBIOS uses. Once you have a graphics card, this might easily happen.

For text windows. why not allocate a screen buffer containing character and attributes for each visible cell?

I;d hope you're talking about a newer version of Connect than I have (I have v1.80). When I unpacked it and tried to tused it it crashed straight away, I zero'ed the disk and put the archive on it and haven't seen it since.

Uniterm's #1 plus: IT IS SOLID!

Nope !! Darryl Still said that Atari do not have a warehouse full of STFMs somewhere. In fact, Atari are having to manufacture the new FMs from scratch and to be able to meet the new price point the manufacturing technique is such that it will be very difficult to upgrade them. I really don't know what they could do to make it so difficult. If we are talking about memory upgrades then I reckon I had a pretty hard DIY job when I upgraded my STFM up to 2 Megs, the most difficult part being unsoldering the video shifter chip and soldering a socket back on. Not having much experience with a soldering iron didn't help and I thought I'd toasted the chip and shorted a track but everthing went OK. So, I don't know what they can do to make it harder. Maybe the MMU will be surface mounted with no socket for piggy backing, that would be a bitch.

Anybody got any ideas how the new FMs could be made difficult (next to impossible) to upgrade ??

Grant.

Also, Warp9 seems less compatible. I sold it within a few weeks of buying it
because it was just about the same speed as the TurboST that I already had,
and would not run with a few programs I regularly use (Cubase and Logistix,
for example). The instructions, though, claim they are compatible with
Cubase if you set up an `override' file, but I couldn't get this to work.

Sorry, Chris, but there is not much hope of Pure C++ ever. I asked about this last
year and this year at the CeBIT fair in Hannover. They told me that they are not
developping C++ because they did not see enough chance to sell it.

What they are announcing is a pretty new Profiler for Pure C and Pure Pascal.
The Profiler is announced for may.

OK, that's the compiling bit. I've got a TT and if I create a ramdisk for
temp folder etc. CC1PLUS compiles at a bearable speed. We're more worried
about the code it generates. It is well known that C++ linkers have trouble
deciding which code is used; also the GNU linker is not as smart as the Pure
linker, in that it includes or discards complete object files, while the pure
linker sees fragments of code within single object files. For what we call
'real world atari programming' you need better linking. A GNU C program is
about 5/4 times bigger than one compiled with Pure C if is DOES NOT use
printf. How about when I've translated it to C++, which I am very tempted to
do. I suppose we'll just have to wait for Pure C++. April, wasn't it?
Sounds good.

2007. appl_tplay()

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-07 16:51:47 UTC
From: ken@isgtec.com
Message-ID: <4522@isgtec.isgtec.com>
Source record: 39355

I'm having some problems using appl_tplay(), any experts out there? I'm trying to play back a single event, which I am using exactly according to the description in the Laser C manual, three args, a char buffer containing 6 bytes for the event, and two ints, the number of events (1) and a speed value which is supposed to be 100 for normal speed. I get about 10-12 bombs when I call it. Is there any setup that must be done before calling appl_tplay?

>location gives flexibility.

I didn't propose an absolutely fixed screen location. I suggested a
window in which the screen could be moved around. For example, the upper
2mb of RAM could be dual-ported, and the screen could be located anywhere
therein. This would preserve the ability to do page-flipping for smooth
animation, while giving all the benifits of VRAM (primarily the
elimination of bus contention, which can only get worse as the video modes
get better. You want 1024x768 truecolor? You'd better believe that it'll
take dual-ported ram to make that work.)

I know it doesn't sound right, but it is true. Also, I think only
4M/60MB hard disk versions are being sold in OZ. I have only seen 5
falcons in the past 2 weeks & they were all snapped up quickly. As far
as I understand the _ENTIRE_ quota for Falcons in australia (and perhaps
the world) has already been allocated to each dealer, so when they sell
out of their quota they will not be able to get anymore for the rest of
this year...

Just what I thought. The plug IS just a straight wire-thru, but the dealer insists you need it. I will make my own when I buy my 030 or 040, it's going to cost my arm, leg and dare I say a testicle as well.

C'mon Atari, even Amigas with similar specs are half the price..

Whoops, speaking of stupid... That should be 1024x768x256 colours.

If the cards were more flexible (or the software), it could handle a
nicer 1280x960x16 or maybe a much nicer 1600x1280x16 (that's exactly 1M,
assuming my brain isn't suffering from the same problem it was a few
days ago).

I'll take Cybercube. From what I've heard, it's a great deal faster than the CrazyDots board...

Then again, from the look of things, the Falcon won't be for sale in North America within the year, so I'll go look at those nice Centris 650s and the Zeos '486s (to drop OS/2 on). :-\

My ST has TOS 1.4, and the high density drive works quite fine.
Required a 3rd party expansion card though.

The only thing TOS 2.06 would give me is the ability to format a high
density floppy on the desktop; not necessary, since I prefer 1.64M
floppies to 1.44M floppies.

Never hear about Overscan? You need very few parts and some software to add
this feature to your Atari. Then you can use a 80*25 window, with a GDOS-IBM
font. A perfect terminal emulation tool, Yep!

No, that's all, but perhaps you'll need a SCSI Hard-Disk-Drive :-) and some cables to connect them all.

> I've been told that it does not have the same connections as a bare drive
> that goes in a PC. Does that mean it's not SCSI and makes it useless ?
The Atari ST doesn't have a SCSI connector but the host adapter has one.

I went to the trouble of downloading this monster but couldn't get it to work either. I can't remember if I got some obscure error message or just the prompt back with no error message, anyway, it didn't work and it wasn't an installation problem 'cos I wrote a "hello world" prog using an include statement for an include file that didn't exist eg "include <rubbish.h>" and GCC didn't complain about it !! I deleted it and fetched Heat n' Serve Sozobon 1.4. LOVELY !! ANSIfied too !

BTW, I tried this on a 2Meg STFM and not a TT, same result though.

I wonder why nobody seems to mention the fact that Connect is unacceptably
s-l-o-w, and has an error in the VT100 emulation. When remotely working with
VI thru Conect, the 'append' command ('A') didn't work right. Very annoying.

There has been a problem concerning TOS 1.04 or older in versions 1.80 or older of CoNnect. This is solved. The actual version is 1.96.

I *do* use NVDI, and still found it unacceptably slow. Mega ST2 and 2400 baud
modem. But maybe I indeed used an older version -- I don't quite remember.
Where can the latest version be found?

>A bug in the vt-emulation?

I think my setup was OK, but, as said before, maybe I indeed used an older
version. I'll give it another try as soon as someone tells me where I can find
the latest version. I currently use the last version of Rufus, and it works
decent -- about 99% of what I want from a terminal program. But that's only
99%, not 100... :).

2028. HELP: Displaying 3D objects in world

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-08 13:49:17 UTC
From: esuoc@csv.warwick.ac.uk
Message-ID: <1q1agtlNN2jt@violet.csv.warwick.ac.uk>
Source record: 39375

Hello,
I'm creating a Virtual Reality Engine on a SUN SPARC ... I've managed
to program he whole 3D graphics engine in C++ ... and works amazingly
fast!
The problem is displaying objects using the "painter's" method; where
objects furthest away are displayed first etc. It may sound easy but then
you have to consider displaying objects which are above and below, and
left and right.....
For example: Imagine your self above the ground, imagine a cube is on the
ground and another cube just above it....

```
* (viewpoint) | You would need to draw cube B first then
\ | cube A.....
\ |
\ |
|
[ ] (cube A) |
[ ] (cube B)
------------------------------------ (ground)
```

The major headache comes when you have a situation like this....

```
[ ] (cube A) | Here you would need to draw cube A then B,
| then cube D then C.....
[ ] (cube B) |
(viewpoint) |
* ------- |
|
[ ] (cube C) |
|
[ ] (cube D)
------------------------------------ (ground)
```

Can anyone HELP me?????
Thank you!
Ajay (Alias Thor) 8*)

Of course CoNnect is slower than UniTerm as it runs in GEM-windows. But this
has on the other hand the advantage, that you can run several sessions in
parallel and can run CoNnect on any graphics hardware.
Anyway - for good speed with GEM-Programs you will need an VDI accellerator
like Warp 9 or better NVDI. And with them CoNnect displays more then 5000
characters per second on my TT.

A bug in the vt-emulation?
No certainly - the actual version works very fine, especially with vi. You
probably tested CONnect 1.0? Or you had a wrong setup?
CoNnect actually has a cleaner vt-emulation than UniTerm or any other Terms-
program on the ATARI. (test this using the program vttest!)

Does any know where I can get a Modula-2 debugger for the Atari ST, like XDBX for Xwindows? I am presently using the ANA-Systems Modula-2 shareware package found at archive.umich.edu. Are there any other Modula-2 packages around for the Atari ?

That's not it either. Bps and baud rate are not "usually very close"!
It depends on the encoding scheme for the bits. Also your use of estimated
vs. actual is fairly bogus. Parallel ports are entirely different, as
are direct serial connections (i.e. no modems)! We are talking about encoding
signals by modulating a carrier through a phone line.

It all depends on how you calculate the distance to the objects.
If you calculate the "exact" distance from the viewpoint in 3-dimensions
to, say, the center of the cubes you should get slightly different
distances which indicate cube D is further than cube C etc.
Cubes should be easy, especially when they don't intersect each other.

I don't think comp.sys.atari.st.tech is the right place for
a question about 3D graphics on a SUN, mail me and/or try
rec.games.programmer if this doesn't get you on the right tracks.

John Keay.

Just curious - what does happen when using 'A'ppend? (I usually use
'a' instead of 'A' - guess I'll have to see it later :-)

Anyways, since Connect uses the VDI, it will be slower,
but should be more compatible with various resolutions in the long
run. Uniterm is faster but only works (correct me if I'm wrong) in
ST Medium and ST Hi resolutions. Connect should work in pretty much
any resolution (in particular the Falcon's plethora of resolutions).
This will allow, for instance, using the 640x480x16 mode to do
standard 16-color ANSI. Likewise, I'd think it would also work properly
on the various resolutions of graphics cards (Crazy Dots, etc), as
well as with virtual screen drivers like DOUBLE2 and MonSTEr.
I'm not totally sure, but I would guess using the VDI is how
Connect deals with the various fonts as well (?)...

To get around the slowness, just use Warp9, NVDI, or some other
screen accelerator - it makes a difference. Actually, I'd recommend
using a screen accelerator regardless of whether you want to use
Connect or not - the speedup on the desktop alone is worth it
in my opinion...

2036. DEC RZ55 hard disk - success

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-08 18:02:04 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <C56FFH.39A@news2.cis.umn.edu>
Source record: 39382

Thanks much for the messages sent by folks about my recent query regarding getting a DEC RZ55 hard drive working with an ICD Host Adapter. It appears that these particular disks are built in such a way that they do not start spinning when power is applied. It also appears that there is no jumper to make them start spinning up when power is supplied. The answer is to run an arcane tape test on a pvax (VAXstation 3100) while a special 'key' is inserted in the serial port to set microcode on the SCSI controller to disable the bit which supresses spinup on powerup. Not something for the home handyperson to do!

In any case, I now have a 320+ megabyte hard drive running with ICD software. I don't know how comparable the RZ55 is to other drives, but the Hard Drive test ICD includes indicates that there is a 1+ megabyte transfer rate ad 19 milliseconds. I am currently debating whether I should keep the default 32 meg partitions or split things up so that I'm using standard TOS partitions of 16 megs with the ICD accessory that allows you to activate or deactivate a particular partition. Suggestions are welcome!

>"state change", so terminology can be considered properly used.

I disagree; "9600 baud" is incorrect usage. Look, 2400 baud means the state changes 2,400 times per second. The fact that each state can be one of 16 "unique signal levels" only means that there's more choice when the state changes; it does not mean that the state changes more rapidly. There are still 2,400 state changes per second (2400 baud), but each change encodes 4 bits (one of 16) so you get 4 bits/state x 2,400 states/sec = 9,600 bits/sec.

] s-l-o-w, and has an error in the VT100 emulation. When remotely working
] VI thru Conect, the 'append' command ('A') didn't work right. Very anno

All terminal programs operating in a window seem to be very slow!
(Text updating).

Stick an accelerator onto the disk (Turbo ST or some such thing), and it
makes things a bit better!

Connect also doesn't look too great in medium res'. (Could be that a newer
version works better, but the version I saw had overlapping icons etc.
as it appeared to be designed for mono' use!)

I haven't seen a program *yet* with proper VT100 emulation. They all
have some features missing here & there. (Enlarged text, highlighting,
etc.) Uniterm does not have the lot, Flash has some Uniterm doesn't,
and vice-versa).

I haven't had a proper look at the VT100 emulation of Inter-Link, I'm
not too sure how good it was.

Connect is also I think programmed in C, which is hardly the swiftest, or
most compacg language! (Good for programming in though!)

All this Baud/BPS stuff is hardly relevant.

Usually, whatever the modem says on the front panel (2400 baud or whatever), is also how many BPS you get.

(although, say I get 240CPS, since there are 8-bits per character, I would multiply the 240 by 8 which would give me the bits-per-second.)

I gave up using baud ages ago, I just say '2400bps' even if it is in-accurate, everyone knows what I mean!

Well I am still trying to fing a program as good or better as Flash 1.6,
and it must have background Zmodem, I thought Rufus and GSZRZACC did this but
no it dose not, also Rufus is no good with Medium Resolution..

No Comms programs should rely on Hacks to get a decent screen speed,
and most screen hacks will kill VT100 support, it must be programed
from the start..

Also most Comms programs that I have tried with not draw VT100 Boxes,
is there a way to Fix these..?

I have tried Stalker 3, but found to many bugs and it would not draw
VT100 screen boxes correctly, puts characters instead..

So come on you Programers how about a Good Terminal program, and I think I have
tried them all, I was hoping for THE STORM, but that is now a none event, and
don't say FLASH II as I here that has more Bugs than Code..:-)..

There have been some good efforts like Rufus and Trapido, but then they get
droped for some reason or another, plus the German programers seem to think
that we all have TT's and run our ST's in mono..

So I am still waiting and it looks like for ever...

Roger..... sheppard_r@kosmos.wcc.govt.nz

In Connect 1.96 (and some other versions) there is a menu under called
LANGUAGE - the default setup is the ST's character set. If you go into
the Language menu and click on "ATARI" you can then change it to "ASCII"
(or something like that) - basically though you can set up that
particular window to use the standard VT100 character set.

That's one of the nice things about Connect - setting up different
windows with different defaults, so you don't have to keep changing
settings - just use the other window :-)

The cursor is positioned at the wrong place -- e.g. somewhere in the middle of
the line instead of at the end of it.

> Anyways, since Connect uses the VDI, it will be slower,
>but should be more compatible with various resolutions in the long
>run. Uniterm is faster but only works (correct me if I'm wrong) in
>ST Medium and ST Hi resolutions.

This might be true -- and I've thought of this myself -- but that doesn't
explain why Rufus (window/VDI too) is so much faster than Connect...

>Connect or not - the speedup on the desktop alone is worth it
>in my opinion...

I'm already using NVDI approx. since it first came out. Of course -- I'm not
that brain-dead :).

Yes, agreed. But I'm only interested in a program that emulates the codes *I*
happen to encounter in daily practice :). For all the rest of the codes it may
crash the ST horribly as far as I'm concerned :).

>Connect is also I think programmed in C, which is hardly the swiftest, or

Newer versions of CoNnect support med-res also and icons won't overlap
any more.

Which one is missing on CoNnect? Enlarged text, highlighting, _blinking_
etc they are all built-in...

Why not calculate the distance from the viewpoint to each object,
and then render furthest-first? You'll have to pick a single point
to represent the location of each object, but that's always been
a problem (i.e., two intersecting polygons will not be properly
rendered with this painter's method).

Use the pythagorian theorem for distance (sqrt((vx-ox)^2 + (vy-oy)^2
+ (vz-oz)^2), I think).

>version I have is 0.94!

A binary version of MiNT 0.95 is available for anonymous FTP on atari.archive,
I think.

All later versions of MiNT may be distributed in source code form only.
Distribution of binary versions is a copyright violation, which could
result in legal action; it will also make it unlikely that future freeware
versions of MiNT will ever be available.

If you want a binary version of MiNT and don't want to compile it yourself,
buy MultiTOS. The freeware version of MiNT is unsupported software, which
is why it's available in source code form only.

I see. This is a problem concerning your tab setup. Probably you set the
tab distance in CoNnect to another value than 8. You can avoid tab
problems at all if you set stty -tabs for your terminal. Anyway
CoNnect can handle tabs correctly.

Except that you won't need to calculate the square root. If a>b then
a^2>b^2, as distances are positive real numbers. Speeds things up
quite a lot.

In a previous article I said CoNnect was slower than Rufus. I haven't been able to do exact benchmarks, but I just tried the most recent version (1.96) and must say that at least it feels as fast as Rufus (and that's what counts, isn't it? :). For the rest the program IMO is *very* good, although there are still some quirks left as far I'm concerned. I wrote the author on these and thus will wait with posting my comments until I received a reply from him, in order to avoid having to post another rectification in case I'm mistaken or overlooking something :).
Everybody in modemland: download the thing and start using it!

Source record: 39258

I have the VT100 character set in action, but it seems to make very little difference. The characters are no longer q's but are an odd little character. Changing the banks to Graphics, and then American (The closest is ASCII (US) so I presume that is what was meant), causes the normal ASCII characters to turn into a complete mess!

It works on Uniterm and Flash in VT100 mode, so it's not the BBS, and since others can do it, I must have something set up wrong!

Clever little program however! Set the lines to 132 characters so I can read all those wierd messages from other folks who do the same thing 8-)

I have a UK machine with TOS 1.2, I also have GDOS loaded, and the connect ANSI font. (I'm using G+PLUS if that makes any difference).

Think yourself lucky.

New Zealand will NOT be getting any Falcons at all, and that's the
official word from Atari Australia.

Is it any wonder that between that and the overinflated prices they're
asking for ST's and Megas in NZ along with nil after sales support
that people are dumping their ST's in favour of PC-clones or macs?

The only people still seriously buying the things here are musicians
(and that won't last too much longer).

I think you're wrong here, I tried Connect extensively with vi and emacs
on Suns and SGIs, and the emulation is excellent. If Connect gets anything
right, it's the vt100 emulation. I would suspect your termcap setup, I
certainly tried append (A and a) including long lines and it works. It is
however slow, improved somewhat with accelerators like nvdi or warp9.
However the text size for 24x80 kills it for me, as I have gone on about
long enough. 8^}

Buy one of the competing multitasking products then.

The freeware version of MiNT is not at all user friendly, nor is it designed to be. Those who want to use it should have enough computer knowledge to be able to compile it themselves. Yes, it is a bit of a hardship having to do this, but c'est la vie... The alternative (not having any freeware multitasking system) would seem to me to be less pleasant.

(Sure, it would be nice if Atari would give MultiTOS away for free. It would also be nice if they gave their computers away for free. Very few companies are able to stay in business long by giving away their products, though :-(.)

Eric

2068. Bug in MiNT/GNU libraries (latest versions)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-11 07:43:21 UTC
From: sourada@iastate.edu
Message-ID: <sourada.734514201@vincent1.iastate.edu>
Source record: 39270

An obscure bug, but a bug nonetheless.

64-bit integers (long long's) will not work correctly with the
current libraries. This is because the compiler and the libraries don't
agree on which order the longwords go in.

To fix this, just un-comment-out the #define WORDS_BIG_ENDIAN line
in gnulib2.c in the source (and recompile, of course.)

If it turns out that this is indeed a bug and not something I am doing
wrong (which is slightly possible), I'll be happy to provide re-compiled
libraries in the near future...

Later,
Steven Ourada

sr> I don't need the socket as I can get that here..

No, actually you probably can't... The PLCC sockets used in the ST's were
one of the two designs that were popular in 1985... unfortunately they lost
to the other design in the name of commonality, and they are now _very_ hard
to find in this half of the world.

sr> So a Address and Phone No. would do thanks, and If you have a price

ws>
ws> (Without using a small-font which ends up giving you perpetual-squint)

Well, depends on what you call a small-font. I'm typing this using the 6x6
system font on an 11" b&w tv. I chopped the line between the tuner and the
video circuitry and fed in the composite signal from the ST... I don't
squint.

But yes, that's the answer, using a slightly smaller font. Not heaps
smaller, just slightly. (ie one of the fonts that comes with CoNnect) Or of
course you can run the 100x38 screen I use on the TT.

Source record: 39274

hubert@swi.psy.uva.nl (Herry Hubert) writes:

> Is it possible to connect an SVGA monitor to an ordinary 1040STfm.

"Maybe"

It depends on whether your SVGA monitor will scan at 15kHz.
If it will, then all you need to do is make a cable to adapt
the atari plug to the SVGA...

If its slowest horizontal scan rate is 30kHz, then you can make your
SVGA display Atari mono.
(Join all three colour i/p's together and connect to the mono o/p on the
Atari.)

BTW: Has anyone ever tried converting an Atari mono monitor into
a Mono VGA monitor?
I'm having problems with changing sync polarities as the VGA card
changes modes.....

I'm sure they didn't think of it... From the benchmarks posted here, it
looks liket he Falcon is _slower_ than an ST in some of the 16-colour
modes. That's a hellish performance hit due to the video, and one of the
many reasons that I'm not going to buy one, even if they do eventually
show up in North America.

That's the main reason I figured I'd use Alt-Fuller to iconify a
window... it's not like anyone is going to go and change the existing
applications so that Closer will iconify the window, and it could be
nasty if someone got confused and accidentally closed a program they
wanted to iconify...

2080. hard disk gone fishing...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-12 15:45:38 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1281@usdtsg.DaytonOH.NCR.COM>
Source record: 39279

I have a question regarding my hard drive. My Megafile30 has, for some unknown reason, stopped functionally properly. That is, I can turn the hard drive on (prior to turning my computer on), but rather than seeing the usual blinking of the access light (which I use as my cue to turn the computer on) this access isn't happening anymore. And as such, when I turn on the computer, it doesn't seem to recognize that the hard drive is even connected.

It just did this "overnight" (i.e. it worked yesterday, doesn't today...). If anyone has any good ideas (or guesses) as to why this has happened (or more importantly, how to fix this problem) I'll appreciate it. Thanks.

From: andre@cix.compulink.co.uk
Message-ID: <memo.121996@cix.compulink.co.uk>
Source record: 39278

The readme file for NeoDesk 3.03 says it can display background desktop pictures in all TT resolutions, as well as the three ST modes. However it doesn't say *how*. Does anyone know how this should be done (filename and format for the picture, etc)?

I have a very nice 640x480x16 picture I'd like to use as my desktop. I can convert it into another format (presumably it uses a modified version of the old Degas format, to cope with 150k files) but I still need to know how to get NeoDesk to load it.

Many thanks,

Andre

GROAN.

- Scrolling a 640x480 16-colour screen means moving 153600 bytes.
- Scrolling a 640x480 2-colour screen means moving 38400 bytes.
- The Falcon is 3 to 5 times as fast as an ST.
- 153600 = 4 x 38400

Understand now?

Anyone who is using 16-colour BIOS-textmode and complaining about the speed
should simply switch to a fewer-colour mode. How many colours do you need
to run GULAM in full-screen mode, anyway?

I wish my ST could do 640x200 2-colour, that way text would be twice as
fast on my colour monitor (in that mode) as my mono monitor.

The 16-colour modes, from the benchmarks posted here, have NEGLIGABLE
bus contention. Only the 256-colour and (mainly) TruColor exhibit
bus contention.

Can you hear the motor spin? If it sounds like the motor is spinning and the usual "jet plane takeoff" doesn't come out of the drive you may have a problem known as stiction. If you do, then all the drive needs is a good slap or two. While crude, this will allow you to use your drive at least until you can get the data off so you can replace it.

Just for legal concerns, I'm going to say I can't be liable for any damages incured from the above procedure.

If your problem is truly stiction the above >>should<< work.

Good luck! Hope that helps!

>
>(I'd have to upgrade to a TT for it to be any use!)

So from reading this, I assume that Multi-TOS is out, easily purchasable for the Atari ST, and has bound professionally printed documentation (or at least UNIX manual quality).

Does anyone know the American distributors who are selling this program? I'd like to order it today and get an over night or same day delivery. I'm very pleased that the bug free version of MultiTOS is now available. I was getting tired or some annoying bugs in MiNT version 0.99 that I compiled.

Thanks for all of the effort Eric. I wish all the people at Atari had your diligence and enthusiasm.

I first would like to apologize for posting this as I know
my question is covered in the Faq list but I couldn't get the
FAQ list since I couldn't get anything that was posted before the
7th of April and don't fins it in news.answers wither.

My friend is selling his Panasonic Multisync Monitor and
I would like to know the scan rate that his monitor has to
support in order for me to use with my MegaSte. What other
specification of Monitor do I need to look into? What are the
models of Panasonic Multisync Monitor that has previously
been known to work with the Atari? I am planning to get
a TT this summer. Will the TT work with Multisync Monitor
also?

I need to know also what kind of switch box I need to have
in order to use it with my MegaSTE and perhaps later with the
TT? Is this box hard to make? If there is any files descripting how to make
this kind of switch box, where can I get it? Or else, what
company sell it?

Thanks in advance

...

From: porret@elde1.epfl.ch
Message-ID: <1993Apr13.081025.1@elde1.epfl.ch>
Source record: 39286

I'm thinking about buying a secondhand TT computer and, as I don't know TTs very well, I'd like to have some information and advices.

o This TT is rather an old one (it has TOS v.3.05). I know that the first TTs were supposed to work at 16MHz, and Atari used an additionnal board to speed it up to 32MHz. How is it possible to recognize such a computer (without opening it) ? Is there any notable differences between the two versions (especially with respect to performance) ?

o Does every TT version include 68882 floating point unit ?

o A test program I used indicated there was no blitter in it. Is that normal ?

o Does standard Atari VGA screen (PCT1426) withstand a graphic card with, let's say, 800x600 pixels ?

o Does the use of fast RAM significantly improve its speed ?

o Is that possible to use a Spectre GCR emulator on a TT ? If yes, which Mac would it be equivalent to ? How compatible is it with Mac programs ?

o Does a way to change resolution without rebooting exist ?

Thanks for your help.

2090. TT SCSI blockmode

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-13 07:10:39 UTC
From: meulenbr@prl.philips.nl
Message-ID: <meulenbr.734685039@cstw168>
Source record: 39288

Hi,

The atari developers doc mention that one should not use the blockmode
of the 5380 SCSI controller when programming the controller.
I was wondering if any of you could shed a light on the following
questions:
1) what does blockmode do? What are the benefits/disadvantages?
2) why should one not use blockmode?
Is this due to the dma controller not being able to handle blockmode??

Anyone any suggestion???

Thanks,

Sigh. The Falcons that were benchmarked were the /slower/ developer
revision models. When some demo coders got their hands on production
Falcons, they are able to perform graphics manipulations in 65,536
colours that would probably be nearly impossible on even 50 Mhz 486s.
When Falcon-specific games are available in the coming months, it
will be demonstrated that the Falcon is the superior architecture
for many applications.

The tradeoff the designers made (resolutions <= 800x600) is more
than compensated by the flexibility of having up to 14 MB of graphics
memory with hardware scrolling support. The upgraded BliTTER rated
at /64 million/ pixels per second is unmatched by no other US$799
or even US$2000 computers that I know of.

Those are some of the reasons why I have to laugh when a Mac user
spouts off about the new Centris and Quadras. I predict that
when the new flight simulators for the Falcon are released and
compard with those available for the Quadra, the serious deficiencies
of the Macs will be graphically evident. Of course, when audio
capabilities are also accounted for, then the question will not
be whether Macs are getting cheaper, but if they are worth more
than a few hundred dollars.

I will also be watching the maturation of MultiTOS with great
interest. Its current capabilities--

- preemptive multitasking
- threading
- memory protection
- multiuser support(?, not sure of this)

The lack of memory protection in the Mac OS is reason enough to
avoid Macs, because one thing is certain--software memory requirements

are growing both in size and complexity. Atari should certainly publicize the defective and dangerous nature of Mac memory (mis)-management.

When Atari is given time to optimize MultiTOS to its fullest potential, it will be reason enough to buy a Falcon computer.

Seems to me that's what things are like in a TT, where the screen
can only be located in ST RAM.

Hi!

In article <1993Apr7.142938.23492@cs.ruu.nl>, avgroeni@cs.ruu.nl (Annius Groenink) writes:
>do. I suppose we'll just have to wait for Pure C++. April, wasn't it?
>Sounds good.

I've just read in the german newgroup, that there's not much hope for PureC++ (next time). Sorry - I would buy it to - Pure Software's software's really smart. There's a profiler incoming - I'm waiting for it.

BTW (to avgroeni@cs.ruu.nl): Don't compare the GNU developing kit to any other developing kit. The GNU software exists on next to every computer and is quite a good tool, but it's really not perfect. We all know it has a (very) low performance and needs lots of memory - even for the plain C. But the other side is: you can get tons of stuff - just compiling on your machine, maybe with minor changes. Compare the DOS-based GNU with Borland C++ (I've never done it, maybe someone can post the result :)). I think it's originally developed for work-station, not for micros like ST.

What would be wrong with putting 2M or 4M of VRAM into a machine? Or 1M,
and having nice VRAM slots (like those evil Macs) so people could (*gasp*)
_upgrade_it_themselves_? Then you can have the screen anywhere in that
1-4M of RAM (hmm, just like an ST, but much faster), and nothing changes
except the speed of graphics operations.

> Atari computers aren't ONLY used for GEM applications! (Despite Ian L)

The main disadvantage of Macs... no TTY, even if you wanted it.

> Atari computers aren't ONLY used for TTY applications! (Despite Chris H)

The main disadvantage of PCs. Then they got Windblows, and everyone went
nuts thinking it was a new thing...

And hey, I use Gemini and STalker all day... ;)

> Fixed-location memory is fine for some applications, but arbitrary-location
> gives flexibility.

It could also be done more intelligently.

Then again, what am I moaning about. The last machine Atari managed to get
out the door was a whopping 16Mhz 68000...

From: erlingh@storlind.idt.unit.no
Message-ID: <ERLINGH.93Apr13140629@storlind.idt.unit.no>
Source record: 39292

In article <1993Apr13.081025.1@elde1.epfl.ch> porret@elde1.epfl.ch writes:

o Does every TT version include 68882 floating point unit ?

Yup. And running at 32MHz too.

o A test program I used indicated there was no blitter in it. Is that normal ?

No TTs have blitter.

o Does standard Atari VGA screen (PCT1426) withstand a graphic card with, let's
say, 800x600 pixels ?

That's what I've been told.
It won't go any higher than that though, it is not an SVGA.

o Does the use of fast RAM significantly improve its speed ?

YES !
We had 2 TTs running alongside eachother.
One with, and one without TT-ram, when you saw them running together, one
could hardly believe it was the same machine...
And the machine with TT-ram (mine) did not have burst-mode RAM, that would
have taken it even further. (Ataris TT-ram card with 16 Mb of
SAMSUNG non burst-mode RAM).

o Is that possible to use a Spectre GCR emulator on a TT ? If yes, which Mac
would it be equivalent to ? How compatible is it with Mac programs ?

I only know that it is working.
Altough some models of the TT has troubles with the GCR-floppy, I've been
told. I do not have the beast myself.

o Does a way to change resolution without rebooting exist ?

That depends on how you define "reboot".
To change between ST-high/medium/low TT-low/medium you enter the
SET-PREFERENCES menu on the desktop. Exactly like changing from low -
medium on an ST.
To change from TT-high to any other mode, you will reboot as you do on
the ST when changing from st-high to any other mode.

Thanks for your help..

Anytime...

I think you might have hit it on the head (no pun intended :-)
I did give it a slight smack, and after a couple power-ups, it started
working again. What exactly causes this? (i.e. how to avoid it?).
Just curious - with the various DC utilties that were released over time,
didn't one have to do with helping avoid stiction? (I'm not sure
if I'm remembering correctly). If so, I might have to track it down...

This is the first time since I've had the drive that this has occurred
(and I bought the drive used (from a sysop I knew)). Oh well, as
long as it's working now!

Two hints:

- comp.graphics would be a more appropriate newsgroup

- The problem can get a lot worse if you have cyclically overlapping
images (I'm not going to attempt an ASCII drawing here :-).
You will have to use a polygon-splitting algorithm or a Z-buffer
if your code can encounter this situation.

Good luck,

Jens.

2101. *** Need HELP with the game "SDI" ...***

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-13 17:18:07 UTC
From: M14563@mwvm.mitre.org
Message-ID: <16BAFBB0F.M14563@mwvm.mitre.org>
Source record: 39296
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi There,

I am currently borrowing the game "SDI" from a friend, (using original diskettes -- no pirating). But, when I try to use it on my Atari 1040 ST, it *bombs* just as the *little man* runs through the first tunnel. Just as the image of the man leaves the screen on the left side, (after this, a disk read *should* occur, loading another part of the program into memory and allowing the player to continue with the game), two bombs appear. My Atari has 4 MB of RAM. I also tried this game on an Atari 1040 STe, (not sure of the RAM size), and it also bombed at the same point. My friend has an Atari 1040 ST with 1 MB of RAM and tells me that he has no problem running the game whatsoever.

Could someone let me know if I may be running into a problem involving my upgraded memory and this particular game? I would really like to know if there is something that I can do to get around these *bombs* so that I can play this game; (really, I am doing this for my sister -- SDI is one of her favorite games. I really know very *little* about this game. All I know is that my sister would play this game for *hours* at a friend's house. So, she would be most appreciative of any and all help 8-)).

Thank you in advance for all of your help. I truly appreciate all efforts to help, (as does my sister). Take care *each* and have a nice day!

(FYI - I am a new Atari user and am *not* an Atari programmer; I am however familiar with IBM PCs and with Macs to a degree.)

Again, THANKS! 8-)

Hy Edward

Just simply put 16 1Mb-Chips with the same speed (or faster) in
the 16 emply slots near the other RAM's. Get also 16 condensators and put
them at the appropriate place.. That's all. The ST is recognizing them
automatically.

> TOS 1.62..

This would be an enormous waste of time, there are exactly two patches
to 1.6 to make it 1.62 (hence the .02):

- fix to the low-res boot/DESKTOP.INF bug
- fix to the memory pool problem

Both are fixed by tiny AUTO folder progs, that are widely available,
certainly on a.a.... if you want to go to the trouble of getting new roms,
get 2.06, which are plug'n'play on the STe.

YEA RIGHT....When Multitos matures, if it ever does will not compete with the power PC and Taligent OS. Yes you will be able to run Mac Software off it. Go spend your money on the Falcon, but for the same price, I'll wait for the PowerPC.....

There is usually no problem in using 4MBit-DRAMs in the ST, the refresh
(which is really done by the video logic) is sufficient (and more than
that) for 4MBit-DRAMs. I do definitely know that it works when using
4MBit ZIPs in an ST and 3-chip SIMMs in an STE, and I can't see any
reason why it should give problems in a ST other than timing or power
supply problems.

RAMs for the ST should not be faster than 70ns and not slower than
150ns. The Power supply lines (especially GND) need thick cables
(anything above 2.5mm^2 is sufficient) - otherwise you may get problems
due to ground bounce effects during refresh and access, when the RAMs
need much more power for a short moment.

And exactly what the 32MHz+32-bit-RAM boards for the Falcon does too. It is
obviously an excellent solution to the problem of video bandwidth. The
Amiga hardware also uses this technique.

[Sorry, I can't remember to name of that 32MHz Falcon board - it was mentioned
in the recent Rehbock transcript though]

>smart. There's a profiler incoming - I'm waiting for it.

I didn't get to see the original message (it expired while I was on our
Easter break), but let me add notes to this discussion...

GNU C++ (G++) is *SLOW* to compile. That's true. However, I have managed to
use G++ on my meagre 8MHz ST for quite a while. However yet, I have now
bought a TT with TT-ram in preference to a Falcon because of G++'s hunger
for CPU speed.

G++ has no debugger. That too is a pain sometimes. Although, there is now
a port of GDB 3.5 that works under MiNT only (and, I presume MultiTOS).

Hey, but gprof (the GNU profiler) works fine with G++.

Now, as far as OO programming on an Atari goes, I think anyone who DOESN'T
use OO programming to some degree for GEM applications is crazy: because
the whole GEM interface is highly Object based - because of the OBJECT
type. My gem++ basically encapsulates and enhances the fundamental GEM
objects (OBJECTs, forms, windows, alerts, VDI, IMG, ...). I do *not*
advocate the use of gem++. I advocate the use of an object oriented
programming language (C++ is best for general applications), and I
advocate the construction of freely available (ie. standard) classes for
dealing with and extending the GEM user interface.

C++ is NOT inherently slower than C at all. In fact, C++ is by deifnition
more efficient than C, since C code is (practically) C++ code and compiles
to (practically) the same object code - that, plus the fact that C++ gives
you more on top of C, means C++ MUST be more efficient.

C++ compilers are NOT inherently slower than C compilers. It's just that
the compiler industry has had a LONG time (relatively) to learn about
building efficient C compilers, while C++ is new (but expanding VERY fast).

C is a great language. But it is unrealistic for large-scale applications.
Even small-scale applications are easier in C++. For example, which would
you rather:

```
/* C code */ // C++ code
foo() foo()
{ {
```

```
int i; for (int i=0; i<10; i++) {
...
for (i=0; i<10; i++) { }
... }
}
}
```

C has only *2* advantages over C++:

1. More users
2. Faster compilers

(1.) is swinging towards C++ all the time as the huge C community moves to the C++ community (comp.lang.c++ is a massive-volume group).

(2.) is getting better all the time as compiler writers compete, and the GNU C++ compiler leads the market, IMO.

Note that when I say a "fast compiler" I mean it compiles code quickly. C++ compilers produce code that RUNS just as fast (faster actually) than code that C compilers produce.

I'm looking forward to an Atari-native C++ compiler - be it "Pure C++" or "Cormeau C++". But for now, I think GNU C++ is what everyone who can use should be using. Plain C is just too damned weak.

Yes, the kernel supports it. None of the GCC libraries have been modified to provide the necessary synchronization locks, though. Not sure if anyone has put it to much use...

>> - memory protection
>> - multiuser support(?, not sure of this)

yes. With the Minix filesystem, file owner and group permissions are also enforced.... Not much you can do about the TOS filesystem, I guess.

I don't think you read what I stated, and I don't want the incompatlbility
that TOS 2.06 has, plus the COST, I play with lots of ST/s and don't allways use
a hard drive that is why I need the TOS 1.62 patches...

Also TOS 2.06 Roms are not all Plug and Play, some ST'e have 28 pin sockets and
some 32 pin sockets and some don't have sockets at all, so how do you Plug and
Play..??

The TOS 2.06 Roms will cost me some $120nz plus postage, the Eproms for
TOS 1.62 will cost me $20nz...

At a later date I might get TOS 2.06 Roms, but I will like to switch them,
but not from TOS 1.6...

Any Help will be appreciated ....

Roger..... sheppard_r@kosmos.wcc.govt.nz

Well, actually if I were you I'd keep a couple of 32M partitions, and then
split the 'leftovers' (ha!) into 2 or 3 BGM partitions, depending on whether
you plan to run spectre, or possibly install a minix FS for MiNT...

p> o This TT is rather an old one (it has TOS v.3.05). I know that the

Which isn't that old. The first TT's were sold with TOS 3.00 and 3.01. The TT you're talking about is a rev. C, the newest ones are rev. D and include TOS 3.06 and a high density disk drive.

p> first TTs
p> were supposed to work at 16MHz, and Atari used an additionnal board to
p> speed it
p> up to 32MHz. How is it possible to recognize such a computer (without
p> opening
p> it) ? Is there any notable differences between the two versions
p> (especially with respect to performance) ?

If I'm not mistaken rev. C's don't have daughterboards (the first one's had a 16Mhz motherboard with a 32Mhz daughterboard where the CPU was located), so they might be fully 32Mhz machines.

p> o Does every TT version include 68882 floating point unit ?

Yes.

p> o A test program I used indicated there was no blitter in it. Is that
p> normal ?

Yes. If the ST blitter would have been implemented, it would have slowed down the 030, so they left it out...

p> o Does standard Atari VGA screen (PCT1426) withstand a graphic card
p> with, let's
p> say, 800x600 pixels ?

No, it's a standard 640 x 480 VGA monitor. You'd better leave the Atari monitor alone and buy a much cheaper VGA or SVGA monitor at your local PC dealer.

p> o Does the use of fast RAM significantly improve its speed ?

Yes, it definitely does. Technically Fast RAM is about 20% faster than ST Ram, but it feels much and much faster. Expecially if running NVDI in Fast RAM and useing ROMRAM, which copies the TOS into Fast RAM. Also a significant increase in speed is noticable when running MultiTos... :-)

p> o Is that possible to use a Spectre GCR emulator on a TT ? If yes,
p> which Mac
p> would it be equivalent to ? How compatible is it with Mac programs ?

It is possible, but only in ST High resolution. Furthermore Spectre 3.0 does not support the internal SCSI hard disk, so you'll have to use an external hard disk for that. Spectre 3.1 ought to support all this, but is not yet available. Spectre emulates a Mac+, so a Mac+ you'll get. It's a fast one though :-) Programs requireing a 68030 and FPU also run undr Spectre.

p> o Does a way to change resolution without rebooting exist ?

Yes, it's just like on the ST.

But do you actually think this applies to OPERATING SYSTEMs as well? For
people who have already bought a computer at the same firm (quite a different
story than with MS-DOS) I don't think Apple charge you for an update of the
system, and they are still alive. I wouldn't call an operating system a
'product', it's part of a product, namely, the computer.

Starting with System 7.1 Apple is charging for updates to there OS. I think
the thinking is that computer hardware is becoming a commodity that can
be bough from the lowest bidder, and that is the software that makes the
machine special, and that is what people will pay for. Hardware companies
will probably continue to ship a basic operating system with there computers
but if you want the latest and greatest OS with all sorts of features you
will have to pay extra for it. Look at NeXT who have dropped there hardware
business and hope to make money by selling there OS.

I have a nice shareware package I would like to put into one archive (.arc, .zoo, .lzh, .whatever). Problem: files are spread across different folders and this directory structure must remain intact.

Which versions of which archivers can cope with this? What would be the command I would use to archive a file with its folder info? (eg. I suppose X A:\FOLDER\FILENAME.DAT wouldn't do the trick?). I would prefer to use LZH but any archive method will do.

If I need a particular version of an archiver, are there any email servers from which I can obtain that version?

It isn't quite this easy. Apart from hidden-surface-calculation which I
haven't heard you talking about, you get problems with non-convex objects. I
once wrote a coloured, opaque surface atari logo that 3dmensionally came
flying towards the viewer, and in some (very rare) cases, one of the planes
gets in front of another where it shouldn't. Ik think this actually only
happens when some points of an object are closer and some are further away,
so you can't really decide which one to draw first.

>diligence and enthusiasm.

Are you being ironic or extremely naive? Remember MultiTOS is a '1.0' and I
don't if you remember TOS 1.0 but I sure do. What you want is just not the
way things work where TOS is concerned.

Have you tried typing an underscore in the MTOS file selector?

Why don't you try zoo! It's not the easiest one to pack directory-trees
with, but it's no prob depacking into a tree.

You must specify each directory separately on the command-line, so if
your directory looks like:

```
ChangeLog
Makefile
README
/man/whatever.1
/src/whatever.c
/src/whatever.h
/src/atari/tailor.c
/src/atari/tailor.h
```

the command-line should look like:

```
zoo ah whatever.zoo man/* src/* src/atari/* *
```

for zoo to pack the entire tree.

To unpack use:

```
zoo x// whatever.zoo
```

zoo will automagically create the folders for you! :-)

BTW, you need zoo v2.1 to use the HIGH-compression method (the 'h' in 'ah').

Happy packing!

Daniel Eriksson (m91der@tdb.uu.se, den@hgs.se)

This is Atari's variation on the SCSI connector. You will need a host adapter ($100 US) and a SCSI hard drive. If you have a MegaSTe with the Atari host adapter then you do not need another host adapter.

Actually, I thought it WAS this easy - if you render back-to-front, you don't need to calculate hidden-surfaces, because they'll be covered up by whatever else youre rendering.

2131. ATARI STUFF FOR SALE

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-14 18:13:45 UTC
From: aag9521@ucs.usl.edu
Message-ID: <1993Apr14.181345.24968@usl.edu>
Source record: 39193

It's finally happened, my old 1040 ST has died,

so, I'm selling all the stuff I had with it, if the

prices don't agree with you, please, feel free to let me

know, and, we could certanly agree on something.

HARDWARE

Seagate 251-1 40MB HD ..... $ 90

Supra DMA to SCSI adaptor ..... $ 25
(software included)

Adaptec SCSI to MFM HD controller ... $ 25

All three ..... $ 110

SM 124 Highres Monochrome monitor ... $ 50

All of the above .... $ 130

SOFTWARE (sorry collection, I know)

LaserC Compiler ..... $ 20
(last version from Megamax)

All of the above .... $ 135

BOOKS

Atari ST internals ..... $ 10

Atari St 3D Graphics Programming .... $ 10

Programmers guide to GEM ..... $ 10

And, the culprit:

Free, for the shipping:

1040 Atari St.

All of the above ... $ 150

BTW: buyer pays shipping.

I don't need to make a deal, just get these things out of my house.
(wifes have no sense of humor about "things" and "gray boxes"

hanging around "their houses")

Any gripes, complains or offers, please email me (tight on time)

and or call me (just about any time) at (318) 235-3489.

Thanks,

Congratulations. Apple Computer now thinks that the operating system is a 'product', and charges accordingly. They even had the audacity to charge brand new purchasers of Macintosh computers (those who bought a system AFTER the release of System 7.1) for an upgrade if it wasn't included in the box.

All operating system upgrades, from any computer manufacturer, now cost you money. MS-DOS 6.0 is $50. System 7.1 is around $70. MultiTOS at around $100 won't be excessive either.

> [gushing praise of the Falcon]

Oh come on, we're leaving the realm of fact here and getting into dogma
and marketing buzzwords. To wit..

> The Falcon is 3 - 5 times as fast as an ST.

Well, maybe some benchmark ran that much faster. I've been using one
every day for 6 months now. 2.5-3 times as fast would be more accurate.

> [Falcon hicolor demos] that would probably be nearly impossible on
> a 50mhz 486.

Bullshit. My 25mhz 386 in 24bit truecolor mode can run circles around my
Falcon in 256-color or hicolor mode. How? Simple: the 386 machine has a
real graphics coprocessor (TMS 34020) not just a bit-mover that's fighting
the main CPU and the shifter chip for bus access.

> Upgraded blitter chip rated at 64 million pixels per second.

Here's where the marketing hype takes over. The blitter chip is clocked
at 16mhz. That doesn't imply that it can move 16 million bytes or words
per second, or that the other processors on the bus would give it that
much time even if it could. If you take the maximum rate at which it can
pump data, and use the 1-bit-per-pixel monochrome mode as the test case,
you can probably cook up a number like 64million pixels per second. As
the car commercials and other marketing hype experts like to say: your
mileage may vary. Especially if you're not fond of monochrome video.

Solder works better. ;^)

>Just simply put 16 1Mb-Chips with the same speed (or faster) in
>the 16 emply slots near the other RAM's. Get also 16 condensators and put
>them at the appropriate place.. That's all. The ST is recognizing them
>automatically.

I added two megs of RAM to my Mega ST2, and it also required the
installation of three 33 ohm 1/4 5% resistors. The capacitors are not
required but are recommended. I also recommend you install sockets for
the 18 pin 1 Meg RAM chips, as it's much easier to replace one if it's
bad.

Of course, you can only do any of this if your Mega ST2 was one of the
models that used a Mega ST4 motherboard with the extra RAM holes
soldered closed. Do some exploratory surgery before you invest in the
chips! And make sure you have a good solder sucker!

Really, it's gonna cost $100? Phew, what a relief! Now I don't have to worry about writing things that are MultiTOS-compatible. I already had my doubts that anyone besides unix-head programmers would even use it. At $100 I think I can rest assured that end users will shun it in droves.

I find ZOO to be absolutely perfect. But then, I only use archivers from within ARCGSH4.1 which makes everything very simple. The only thing is, if you want to create a new archive, you have to type its name in the file selector that opens up when yoy call Zoo, then choos "add files", then select the files to be included. If you want to include a directory, and all subdirectories, simply enter the directory name at the file selector prompt, since no file selector will let you select a directory without opening it. Then, just hit OK.
Seems simple enough to me!
P.S. I try to avoid LHARC like the plague. Too many incompatible versions around!

It's their loss! I like ZOO, and likewise do a lot of other users.
Especially users that are fond of the Unix programming/filesystem
environment.

: Its near imposible to redirect the out put..

Well, it's not impossible, but I can agree with you that it's not
widely know how to do it.

: I think sticking to LZH201L or the New STZIP 2.2 will be far better,these
: do work on small 520k one drive ST's...

I might do just that the day they can handle full Unix-filename-
compatiblity. Why don't you try packing files with filenames longer
than 8+3 which also is case-sensitive...

Also, it would be a good thing if LHArc (whith the -lh5- method) was
widely available for *ix-systems. However, even though I've looked
for the source I haven't been able to find it. Anyone got it or know
wher I can find it?

: Take it from some one thats tried them all....

FYI, so have I! And hey, no flames please. The last thing we want is
another flamewar.

Many people said:

> [G++ on atari.archie.umich.edu crashes at startup]

Egad. There was a bad version on a.a for a while - I'm not sure what is there now. I have 2.3.3pl2 from a European site and it works like a charm. Someone with 2.3.3pl2 should upload it to a.a, I guess (my copy is now at home).

Don't forget that G++ is now part of GCC - all three compilers come with the same driver. Usually the files are named like this:

gcc233ba.zoo == Binaries for GNU C compiler, version 2.3.3
gcc233bb.zoo == Binaries for GNU C++ compiler, version 2.3.3
gcc233bc.zoo == Binaries for GNU Objective C compiler, version 2.3.3

While it's true that the MegaSTE has an internal host adapter, you still need an external host adapter (such as the Link) to connect SCSI devices to the external ACSI port. The MegaSTE does not have a SCSI port (unlike the TT). The internal host adapter supports only the internal drive (unless you do some major fidgetting).

I am not a UNIX head, although I know some... I am not a programmer... but
I am getting there... but I _will_ buy multitos just for the pure fact
that I will be able to task switch on my TT without worrying of programs
fighting each other (of course if they work..) and I will be able to use
programs that have good and bad points together and send files flying to
one and the other even if the disk I/O isn't pure multitasking.. what I
see is my TTM 195 filled with Calamus SL, Outline ART 3.0, and Megapaint...
what an awesome setup that will be!!!

bye...

oh BTW what C compilers for the ATARI are ANSI certified?? I am going to
get one pretty soon..

Hi there Daniel?

Not only do I KNOW Zaphod,
he also granted me free DL, unlimited session time and Elite access
on his ICS HQ board Eagles Nest halfway January '93 (as did Troed for
his Sarcastic Existence BBS - they might inform you why)
- which must be about the time I leached his dialer as well.

Oh well: "To err is human" sort of fits in here ;-). I guess you
haven't hooked up to MegaNet lately, so here are the specs of the
Rowdy Dialer again:

* DTMF
* CCITT 3, 4, 5/R1
* R2 forward and backward
* Red-/greenboxes
* ATF1 (B-Netz) signals
* Tone slots
* Line- and other signals

all preset under 10*16 MF-keys and up to 99 songs and fully user
definable wrt frequencies, timings and volumes, and features a.o.

* number scanning
* guard banding
* sweeptest
* frequency stepping
* advanced song programming/invocation
* preprogrammable songkeys (10*10)
* direct mark time/volume stepping
* pasword protected key logging
* program execution

presented through a luxurious graphical interface,
and step-by-step introduced in a clearly written 20 page manual.

(which btw is nothing BUT a user manual !)

Enjoy!
RowdyB

: I was wondering if there are any programs which will allow the Atari St to do
: UUCP mail? If anyone has any info please leave reply or leave me e-mail.

Have a look around for a system called Hermes. The version I've seen is 1.04
but I believe that there is later versions under development. It does
complete mail and News handling.

2146. Floppy Drive Replacement

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-15 03:30:05 UTC
From: gbernath@oucsace.cs.ohiou.edu
Message-ID: <1993Apr15.033005.16343@oucsace.cs.ohiou.edu>
Source record: 39208

Drive A is slowly dying on my 1040stf. I scoured _Computer Shopper_ for a new 720k drive, and found out that nobody sells them anymore. Seeing as 1.44m drives are down to $43, the question is:

1. Can I pop in a 1.44m drive and use it as a 720k drive? (I know I couldn't use it as a 1.44m drive without further hardware modifications.) And if yes, what sort of special tricks or special brand of drive is needed?

2. If this is impossible, where can I get, how hard are they to install, and how much are 1.44m upgrade kits?

I'm looking for the PETRA sound driver (which can work with the
well-known PAULA module player, and is FREEWARE)

Does anybody know where it can be found (ftp etc...), or
does anybody own it ?
In those case, a simp0le mail to me would be kind !

Hey, I have a GEM of a Computer not a Unix workstation, tell me how do I use
Unix file names on my ST or E..

Unix on Atari computers must be a BIG JOKE, here no one uses it, so why not
houses for cources, the Atari range of computers were built with a built in GEM
a simple GUI far better than a command line thing..

ZOO is definitely not for the first time user, its the only one that I have
problems with and even with a shell to drive it, and note, I have had a ST
since 1986 and have been in Computers for some 20 years or more..

ZIP 2.2 would be the easyest one to use, has a nice GEM interface that does help
a lot, and LZH201L has all the Features that ZOO has and more, will extract
multible files and will let you create folders that are not there to extract
to, has a simple way to set the base directory when archiving files that are
deep inside folders, LZH will allso extract, creating directories with out
having to enter a command at all, you just pass it the file name and the
optional destination (Note, Drive as well), if the destination folders are
not there they are created...

There is one bug with LZH201L, its the Time and Date, with TOS 1.0/1.2 it will
reset time/date to the current time and date of extracted files, this can
be fixed with a TSR...

So Please, we are all not Unix freeks that use Internet/Usenet,
so Please keep your bad habits to your self..:-)..

>* UUCP: whitcomb%aurfs1.aur.alcatel.com@rockdal.aud.alcatel.com *

The Caps should be fitted, they are small 0,22uf low voltage 63v?
monolithick or what ever type ceramic caps...

The sockets are a must if you end up with a bad ram chip,
if you have the Mega 2 that does not have the holes, use SIMMS to give you
the other 2 megs, very easy to install, I have done a Mega 1 to 2.5 megs,
it had a larger type PSU that I have seen on ST/E's far bigger heat sinks,
it was the same as the one seen fited to a STE, but the heat sinks were
longer and twice as thick..??

>
>ALan

Its not so easy. The MIDI & IKBD ACIAs are wire_ANDED together and feed into
an _edge_ triggered input on the MPF. Thus when you fake a call to
the TOS IKBD handler you can either

1 Reset the IRQ line by resetting both ACIAs; but then the TOS IKBD handler
will ignore any character in the IKBD ACIA.

2 Leave the IRQ pulled low; but then there is a window when MIDI events will
be lost since the MIDI ACIA will not be able to generate a falling edge
on the IRQ line to cause an interupt until the TOS handler (which is
excruciatingly inefficient - take a look at the ROM) gets arround to
resetting it.

Actually using the hbl is inefficient - you can do better by catching the interupt
you want to make interuptable and lowering the IPL. But in either case you must
mask of other interupts (on MFP) since TOS is highly non-renterant.

I thought I had found the perfect solution to the MIDI input problem a while
back when I wrote EKSEQ1 but I've since had reports of EKSEQ1 bombing with
pre-blitter TOS versions so I'm no longer so sure.

I've dissembled various budget sequencers and they do nasty things like disabling
the mouse during record or (2) above and occasionally drop notes. I suspect the
only way to be 100% sure of getting every event and being compatible with every

version of TOS is to ditch TOS altogether and write your own IKBD handler/ window system. This is what I'm doing for my next MIDI prog.

Does anyone know if this problem has been fixed on the falcon?

> Well, maybe some benchmark ran that much faster. I've been using one
> every day for 6 months now. 2.5-3 times as fast would be more accurate.

There's the incriminating admission that was missing from Ian's
benchmark test. He has a developer's preproduction Falcon that
is substantially slower than the production models. Readers here
may remember that Atari did not start shipping the latest revision
(rev. 4?) until the latter part of December 1992. Ian, in fact,
may possess the model that was exhibited at Atari Messe/Comdex
which were definitely the 'wait-stated' units.

I don't want to say Ian is wrong in publicising benchmarks and
remarking about a machine that was still in development (though
DEC employees PLEADED with people to refrain from benchmarking
an ALPHA system that was open for public use, because it wasn't
prepared for those measures) but he or anyone else should make
clear which revision Falcon they are testing. What could be
more fair to readers simply interested in facts rather than
fallacy?

> the main CPU and the shifter chip for bus access.

Interesting to know that the 34020 is standard equipment in PCs.
Let's accept your claim. I want to use a graphics application

that requires a 10 MB 16-bit colour map that I am able to scroll at high speed. Let's see your 'real' computer handle that.... and also try emulating a DX-7 synth at the same time, just for fun. I suppose that 34020 is useful for all the PC games that support it too.

You see Atari had no /intention/ of creating a dragster; they made the world's most 'sportiest' computer. For reckless speed does not always win, in a world full of curves.

Well. Put minix.xfs on C:\, mint.prg into c:\auto and reboot. Then insert a
Minix formatted disk into drive A:. That's all.

I guess that you'll be more interested when someone comes up with a machfs.xfs
or a hpfs.xfs :-) Hint: they -- too -- have long filenames.

GG>them at the appropriate place.. That's all. The ST is recognizing them
GG>automatically.

Hm - most probably, no. You will have to add 3 resistors (68 Ohms) which
are needed in the RAS/CAS lines between the MMU and the new memory bank.
Atari left them out in many 2MB STs. Look near the MMU or old RAM
banks - there will somewhere be 3 68Ohms resistors and 3 spare places.
They connect to pin 3 (/RAS) and 16 (/CAS) of the new DRAMs.

Furthermore, be sure not to get RAMs which are faster than 70 ns or
slower than 150ns - both can cause problems.

>doubts that anyone besides unix-head programmers would even use it. At
>$100 I think I can rest assured that end users will shun it in droves.

(1) I think $100 was some user's guess -- so far as I know, prices haven't been officially released yet for MultiTOS sold separately. (I certainly could be mistaken about this).
(2) MultiTOS is shipping free with Falcons (the present tense is intended).
(3) Obviously you had a bad experience with the developer's beta version of MultiTOS. I'm sorry to hear that. But MultiTOS as shipped to users is very different. There's nothing particularly "unix like" about it out of the box. The underlying functionality is there if people want to take advantage of it, but what the end user sees is GEM -- a lot more of GEM, in fact, that in regular TOS, since even TOS/TTP programs run in windows now.
(4) I can think of no particular reason why you would *want* to write things that are NOT MultiTOS-compatible, unless of course you're a "unix-head" and hate having to use GEM. I somehow don't think that applies in your case :-).

Regards,
Eric

The opinions expressed above are probably not shared by Atari Corporation.

I believe Apple system software before 7.0 is available free (Apple even
has an FTP site with various system softwares). However, I think
they now do charge for upgrading to System 7 software. Interesting
that as the price of their machines has gone down, the price of the
system software has gone up. "Things that make ya go hmmmmm..."

Of course, a computer is useless in general without system software.
Thus some such software needs to be bundled with the system. However,
upgrades are another story - normally you don't "need" an upgrade,
but really would "like" to upgrade (i.e. you can still survive on
TOS 1.0, DOS 3.3, System 6.0.x, etc, but upgrading has it's advantages)...

The same point I made on GEnie.. Who would pay $100 for an operating system,
when they only paid $300 for their machines?? TT users, I could see it..
Falcon, they come with it (of course, we may not see either in this country
until the next millenium).. Would I buy it for my 1 meg STFM?? NO!!
I want to see Atari bring out a REAL machine before I invest any money..
I'll keep the 1040 for experimenting..

>$100 I think I can rest assured that end users will shun it in droves.

And the unix head programmers probably will be the last to really need multitos, as it is only really necessary if you swear by GEM (and multitasking off course). I alredy feel rather unix'sh on my 1040STE with 2M and MiNT, so I can live very happy for a long time, as I always considered the desktop as a much inferior shell compared to GNU emacs (yes, emacs, I'll have it as my login shell as soon I have the memory for it).

But a price that high, somebody is sure gonna create some PD multi-gem server like thing done the road. It probably will not be as slick and elegant as rewriting the OS, but for the non-unix end user it probably wouldn't matter too much.

I have an Atari ST/E with a single 3.5" floppy disk drive. I'd like to transfer MIDI files and ASCII text files created on the Atari to a 3.5" disk that can be read by an MS-DOS machine. Any suggestions?

Thanks,

Dale Green

I have a question regarding the Falcon and it's IDE interface. From what I've read, you need a 2.5" IDE drive to fit within the Falcon. What I would like to know is how one might put a *1* inch IDE drive into the Falcon?

The reason I ask is because I've seen a catalog from a computer company that is selling a Maxtor 7120a IDE drive (120MB) for around $300, and that seems like a great price I would think (spent more than that on my Megafile30 :-). Sure would be a nice jump up from my current 30 megs (really 20 megs, as 10 are in Spectre format).

Haven't checked Computer Shopper or anything like that, so I'm not totally up on the prices, but it didn't seem too bad...

That's just reminded me: another quick fix which often works is to hide the mouse before starting your sequencing, and restore it afterwards. This doesn't get rid of the problem entirely, but it speeds the system up enough that you're less likely to notice it.

2167. RESERVE, MALLOC, and TT Ram in GFA Basic!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-15 20:09:51 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1qkfefINNqhk@shelley.u.washington.edu>
Source record: 39215

I'm using GFA Basic 3.5 and 3.6 and I am having trouble allocating memory. I want to allocate two blocks, one in ST ram for screen memory, and the other in TT ram for some data. I want to be able to do this regardless of the memory that the compiled program was loaded into. Before I can allocate memory, I must use the RESERVE command so that the program doesn't use all of the free memory, that way I can use malloc() to allocate my memory blocks. I can use GEMDOS($44,...) on the TT to allocate memory wherever I want. This is known as xmalloc().

My question is, when a GFA program loads, does it use all the memory in the area it loads into and free the other memory? For example, if the program is set to load into TT Ram, it supposedly owns all of TT Ram, right? Does it also own ST Ram? When I use RESERVE to shrink the memory it uses, does this just shrink the memory in the Ram that it loads into? So if I want to xmalloc() some memory in the other Ram, do I need to RESERVE to that area also? How do I do that? Can I use the $mXXXX command of the Linker so the program doesn't take any more memory than it needs? I've had trouble with it. Of course, GFA 3.6 has a HUGE bug with the RESERVE command in that it doesn't let you "UN"RESERVE. I've been compiling with 3.5 to avoid that problem, but maybe 3.6 handles TT ram and the $mXXX option better.

You can see the dilemna I'm in. If anyone can help, I will be most appreciative!! Thanks.

> Ian ... has a developer's preproduction Falcon that is substantially
> slower than the production models.

I hate to burst your smug little bubble, but I in fact have *two* Falcons onsite here, a preproduction model and the more recent release you allude to which I received during the last week of December 1992.

The main difference between the two machines is that on the earlier model, memory accesses required 5 CPU cycles, on the later release they take 4. In practice, there is only a very small noticible difference in the speed of the two machines.

I was also accused of unfairly benchmarking the Falcon. In fact, I did no such thing. I specifically repudiated a prior mention of benchmarks (which as we all know are pretty worthless) and gave instead my general impression of the machine, based on the fact that I've been sitting at one and *using* it for 16 hours a day, for quite some time now. Over 4 months on the latter-model Falcon, over 6 months if you include my prior experience with the pre-production model.

Don't get me wrong, the Falcon isn't a bad machine. But it's also not comparable to a 486/50, not even close. What it is close to in many ways is my 386/25 system, when running in text modes and doing non-graphics things. The fact that the Falcon can get about the same amount of work done in text mode as a machine running almost twice as fast is pretty impressive, really. But in terms of graphics work, it lags far behind the capabilities of the mid-line 386 systems. (And as the programmer on the team for Autodesk Animator Pro who wrote all the video device drivers plus a fair amount of the rendering code, and also as the sole programmer currently working on Cyber Paint for Atari machines, I feel that I'm in a pretty good position to judge the relative merits of graphics processing between the two platforms.)

It depends on your calculations that determine what is at the
back and what is at the front. If you have a large polygon and a small
polygon then your calculations for the centre, and hence their
approriate depths could give you erronous results; answer (to some
extent) smaller polygons!

> the best archiver

I have to agree that ZOO is the lamest of the available archivers, and should be shunned by all thinking people.

LZH201L is good, it's what I use the most. The only problem is has is that it isn't very compatible with its MSDOS cousin. I frequently port source code back and forth between my Atari and MSDOS machines using LZH201L, and if the archive was created on MSDOS, then on the Atari side the 'f' and 'u' commands don't work well at all. It makes wholly bogus decisions about what files are out of date; apparently something about the timestamps in MSDOS LZH archvies confuses it.

It's also a bit annoying (I think) that the Atari version is so facist about keeping the files in alphabetical order in the archive. If I add a file on the MSDOS side, it doesn't get put in alphabetical order by the MSSDOS LHA program. If I then take the archive to the Atari side and do an 'f' or 'u' on it, the non-alphabetical entry confuses it, and it tends to add all the files to the archive again, putting duplicate copies in the archive.

Even with these problems, it beats the heck out of ZOO, though.

In fact since the Atari line has no actual text mode (like the PCs do, in hardware) then the Falcon in text mode is still doing graphics! So you can be even more impressed by the Falcons ability to get the same amount of work done in text mode as a 386/25 (since the Falcon is really doing 'graphics').

Hey, people that think can make their own decisions, right? People like me will, whatever you say or think, use ZOO anyhow since it fills our needs. Neither LHArc nor ZIP does! If that by your definition makes us 'non-thinking-people' then it's you who doesn't think! Think about it! :-)

[stuff about LHArc removed]

: Even with these problems, it beats the heck out of ZOO, though.

Q. By who's definition?
A. By Ian's definition!

It's a matter of what you want from an archiver. If you are satisfied with what LHArc gives you, then by all means use it. If you, on the other hand, feel ZOO gives you the best value/diskspace-ratio then use that instead. In my little 'non-thinking' world I would never use an archiver that truncates some of the filenames when I'm playing around in my Unix-like environment.

Happy thinking! ;-)

[all replies via email if possible, I'll post a summary if the need arises]

Hello! I am posting to these news groups for a friend of mine who just bought a Falcon030 (first one in Tasmania/Australia :)). Anyway I'm an amiga coder myself so I dont know much about how the falcon documentation works, but if anyone has some documentation they can send to to send to my friend (Cepheus) it would be thankfully recieved!

Anyway If i recall the Atari ST's have a BIOS style OS interface so a list of trap numbers and registerized parameters and control blocks would be nice.

Basically I'm after any falcon programming docs:

- Operating system docs & include/definition files.
- Hardware level programming (register maps etc...)
- Maybe some docs on cycle counting for a 32 bit 68030 on a 16 bit memory interface. [ie how do the memory transactions work!]
- Also information on the exact nature of the 32 bit wide [dma/graphics and sound system] bus would be nice, so he can work out slow downs etc...

Thankyou for your time.
Regards, James McCoull.

PS. No lectures on hardware bashing over OS programming please. These docs are headed for a professional Software Engineer who likes a little fun when he is not working professionally.

PPS. Surely someone must have hardware docs on the register set? I already have similar docs for the A1200 [lame yes], and CBM dont even release these!

>to do this.
>
>Thanks,
>
> Randy

although I never bothered doing it, this is how I'd go about it :

call sfirst("*.*",8) (GEMDOS $4E or 78)
The return value will point to the DTA buffer. The filename can be found
at byte offset 30 (I dunno what the item name is for the C structure, but
it's the last one). We specified 8 as attribute, so we'll get volume labels
only. Since there's only one ...
Call Rename(buffer + 30,newname) (GEMDOS $56 or 86)
Voila !
Let me know if it works.

Patrick.

PS. Boy, it good to be able to take time to answer to news again. studies
are driving me nuts ! ;-)

2181. Re: Baud vs. bps (was: Re: Falcon serial speed?)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-16 02:36:23 UTC
From: a644690c@edinboro.edu
Message-ID: <1993Apr15.213623.10063@edinboro.edu>
Source record: 39145

Someone asks:

> How does one symbol represent 6 bits? Different frequency contents, phase
> shift, etc.

Phase Shift Keying (PSK) is the method used in most modern modems. If 1 baud = 4 bits then there COULD be 2^4 'Phase Angles' in the PSK. (A phase angle being how many degrees out of phase with the last signal). But with 9600 BPS modems, there are only 12 phase angles and 4 of those angles have 2 amplitudes for a total of 16 distinct signal elements. I do no know the specifics of using 64 signal elements for 6 bits, but I am sure it uses a combination of Phase angles and amplitudes as well.

Someone mentioned that baud and BPS are usually pretty close. That idea is clearly false if you consider 2400 baud can transmit 9600bps using QPSK (Quadratic PSK).

FSK (Frequency shift keying) is the method most used with 2400 BPS modems. (This is just a simple frequency that is modulated high or low to send a 0 or 1. I suppose that FSK could be used for multi-level signaling, but I have never seen it though).

Another note:
Since a phone line has a bandwidth of around 4000k, PSK is best suited for the higher transmission rates (for reasons that escape me at the moment). According to Nyquist the max. channel capacity of a line is: c=2W logM. The Log is base 2, M is the number of Signal elements and W is the Bandwidth. Signal to Noise Ratios also have a grate deal to do with the Transmission rates.

First off, I'll say that I'm virtually 100% ignorant on the topic. (Hence,
this question...:)

Why are you using (or do you want to use EMACS as your shell? I was/am under
the impression that it's a high-powered text-editor....(???)

Is it a GUI replacement for GEM? A CLI replacement for GEM, or what?

-Matt

2184. Funky Floppy in a MEGA ST4!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-16 06:13:33 UTC
From: 01mbmccabe@leo.bsuvc.bsu.edu
Message-ID: <1993Apr16.011333.18154@bsu-ucs>
Source record: 39156
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm having a pretty severe problem croping up on my MEGA ST4.

I'm still in the process of "isolating" the problem, but am pretty sure it lies in the floppy drive.

I'm running off my HD with the floppy completely unhooked (it's sitting on the floor.:)...

When it was still hooked up and "running" I could be doing something (anything) on the computer and the system would appear to go into what I would describe as "reboot mode." Everything would stop and the system looked as if I hit the RESET button and kept hitting it about every second or 1/2 second. In between these "resets" the computer would attempt to re-access the floppy as it would normally do at boot-up time, but rather than reading the floppy woudl re-enter "rebott mode."

My first attempt at solution was to sharply smack the computer case directly ove where the floppy resides. This would temporarily allow the computer to continue with normal boot-up procedures, but would end shortly by having the system go back into "reboot mode."

My next atempt was to boot with no floppy in the floppy drive. This seemed to help, but after about 15 minutes something happened (I couldn't tell what) and the system again when into "reboot mode."

As I stated at the beginning, the floppy drive is now completely disconnected and is sitting on the floor. I've had the system up and running for about 30 minutes straight and still no "reboot mode." KNOCK ON WOOD!

Could anyone give me a positive ID to this problem?

Am I going to have to get inside the floppy drive and re-secure some loose chip , or is this indicitive of a trashed floppy drive? If so, then what sort of replacement drive is required?

Any help or comments (or condolences:) would be appreciated!

-Matt

Format your disk on a MS-DOS machine to the appropriate size
(720K or 1.44MB). Your Atari will be able to read from or
write to it as if you would have formatted the disk on the
atari.

2190. Silly question about Sversion()

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-16 13:11:25 UTC
From: pcxkrm@unicorn.nott.ac.uk
Message-ID: <1993Apr16.131125.29597@cs.nott.ac.uk>
Source record: 39237

I've RTFM, and even tried a sample program from the MWC manual, but I still can't get the gemdos Sversion() function to return my TOS version number. I have an STe, with TOS 1.62 according to several other programs. What I want to know is, how can they tell?

As I say, the Mark Williams C manual gives an example of the use of this function, but I've tried it and it returns garbage. Taking the value returned from Sversion as a long (32-bit), then assuming the lowest byte is the increment, with the next-lowest byte the major version gives me a version of 00.23 (or 00.17 in HEX). Is this some other significant number? Perhaps a Gemdos version number rather than the full TOS? - or am I being very dense and missing something here?

I would quite like to know, as I'm writing stuff for different systems and need to know little things like whether I can use the extended file selector etc... I don't have access to any other TOS versions to see what this call returns on them.

>
... rest deleted ...

You've got to be careful. The 2.5" IDE drive is _REALLY_ tiny. In fact
the 2.5" is the diameter of the drive, not the thickness! If the 1" drive
you mention is for use in a laptop/notebook, then it should fit with the
proper fittings. I've seen the new Quantum 1" drives. They are 1" THICK,
but it's 4" wide and 5.5" deep.

Hope this helps (and I hope it' right :) # flame bait ;)

"Just do it." :) If you format your floppy as 720K, Double-Sided, your DOS machine should be able to read it just fine. If for some reason the DOS machine is too fussy, then try formatting the floppy on the DOS machine first and see if your ST can read that. Make sure you format it as 720K, not 1.2 Mb if you have a hi-density drive on the pc.

BTW, Macs with Superfloppy drives (3.5" hi-density) can read ST 720K disks just fine, too.

Robert, don't get *form factor* confused with *height*. The 2.5" IDE internal drive for the Falcon is 2.5" wide (the form factor). That's the current standard for notebook computers.

The 1" Maxtor drive you are talking about is 1" HIGH but is 3.5" wide. It's pretty tight inside the Falcon case already and shoehorning a 3.5" drive in there might be a pretty good trick. Save your money for a larger capacity 2.5" IDE drive or get a SCSI external unit.

Sversion() returns the GEMDOS version number, which is not the same as the TOS version number.

> I have an STe, with TOS 1.62 according to several
>other programs. What I want to know is, how can they tell?

The TOS version number is in the OS header, which you can find by doing:

```
long *sysbase = *((long **)0x4f2L);

sysbase = (long *)sysbase[2]; /* this gets the real OS header in ROM */
tosversion = (short)(sysbase[0] & 0x0000ffffL);
```

I think TOS 1.62 would give tosversion == 0x162, but I'm not certain of this (it may be in decimal instead of hex).

Oh yes, you have to do the above in supervisor mode, in user mode you'll get a bus error.

Regards,
Eric

But who would really want MultiTOS on a STFM anyway? I realize that a large number
of Atari users are still using these machines, but sometimes you just have to
realize that progress has a price. You can't reasonably expect to run the software
of today on the machines of ten years ago, right? Like you said, the Falcons
ship with MultiTOS and most TT owners are probably not just game players (and
MultiTOS will be quite nice on a TT anyway) so the investment will be worth it.

The way I see it, MultiTOS is best on the NEW machines which come with it
for free -- if you want to use it on the older machines, go ahead but don't
expect a miracle.

I think Broadie said in a GEnie RTC that what's preventing them
from releasing MTOS freely is their license with DRI for TOS
(or whomever owns the rights now).

Just think though - once you've got the basic MultiTOS setup, the
upgrades *to the MiNT part* probably will be free. By this,
I mean that versions of MiNT above 1.0 (like what's on atari.archive...)
are part of the MultiTOS system. Thus, bug fixes and similar things
possibly could be released online (let me know if I'm assuming
right, Eric).

I'll probably get MultiTOS (what the heck, add that with my
MultiGEM - hmm, I wonder what happens if you run them together :-).
Anyways, a price like $50 would be nicer, but people have to make
a living...

Looking at the drive and where it's mounted in my Falcon, I don't think it
would be too hard to put a 3.5" wide drive in. You would need a different
set of mounting brackets, but the board holes are already spaced wide enough.
Now, thinking about the length, that might be a different problem entirely...
Best bet - find a 3.5" drive and measure it, then measure the space inside the
Falcon, before you buy. It could work, but will definitely need new mounting
hardware.

>this (it may be in decimal instead of hex).
>
This is (presumably) true - Eric Smith "should" know. But in all
TOSes I've seen the TOS Version can be found from the third and fourth
(Hex) bytes at the bottom of memory. So if you have ST-DOCTOR or some
other program that allows you to look at memory (TINYTOOL?) you can look
at it directly.

Unless Eric knows of some TOS where the address pointer at
location 0x4f2L is NOT 0x2L, a simpler version of the above, would be

include <osbind.h>
main()
{ unsigned short* i; long lo;
lo = Super(0L);
i = 0x2L;
printf(" Tos_Version = %x\n",*i);
Super(lo);
/* Better wait for a Key press before exiting */
Crawcin();
Pterm0();
}
```

and presto you have a program that should display 162 if you have TOS 1.62, 106 if you have TOS 1.6, 206 if you have TOS 2.06, 102 if you have TOS 1.2 etc. All these I can vouch for but don't know if this will still work on the TT or Falcon.

Speed of Light version 3.0 supports the FPU for averaging and can average
a shrunken picture in about twice the time it takes to just "cut" out the
lines. It's pretty impressive compared to the normal CPU average! There
might also be some fractal programs that use it also..one that's TT specific.

>'graphics').

It never ceases to amaze me how folks on usenet find a way to make a
pedantic comment, no matter how precise you try to be in working things.

Let me try again, give you pendants more to work with:

When running applications that don't involve much screen output of any
sort, for example compilers and similar file-in/file-out work, the Falcon
is pretty comparable to the 386/25 system in terms of how much work gets
done in a given amount of time. This impresses me about the Falcon.

If we're talking about screen output of any sort, even "text mode" ASCII
output, then the 386/25 beats the Falcon by hundreds-to-one type ratios,
in direct proportion to how much output is being dealt with. The 386/25
can scroll text hundreds, of times faster than the Falcon. It can move
pixels around dozens of times faster. This depresses me about the Falcon.

Hmmm. Apparently the only thing more prevalent than pedants on usenet is folks who will happily flame a joke. I guess my new rule for plays on words has to be: if it would go over the head of a 6th-grader, avoid it, because someone will take it as serious and flame it.

I guess a secondary rule will have to be: even though the entire context of a piece makes it obvious you are stating a personal preference or opinion, you'd better put phrases such as "in my opinion" in every sentence, or someone will accuse you of trying to tell them how to think.

Hi,

I heard that Atari are developing a new video console system named the jaguar - Is this true?

I would very much like to find out more information about this system, in particular :-

1. Technical details of the console hardware.
2. Launch date (both in USA and Britain).
3. S/W Development systems pricing and availability.

If anyone could give me an email or FAX reference for Atari, that would be great

I would greatly appreciate any help at all on this, please email me.

Thanks for your time.

Roger

I still think that "mild flamage" was called for. :-)

: Hmmm. Apparently the only thing more prevalent than pedants on usenet is
: folks who will happily flame a joke. I guess my new rule for plays on
: words has to be: if it would go over the head of a 6th-grader, avoid it,
: because someone will take it as serious and flame it.

Ok, I suppose I'm as stupid and immature as a 6th-grader. But Ian, please
tell me why I should take the following as a joke:

"I have to agree that ZOO is the lamest of the available archivers, and
should be shunned by all thinking people." and "Even with these problems,
it beats the heck out of ZOO, though."

I find it especially hard to enterpret as a joke when looking at the
other articles posted around the same time (where for example our own
Aussi-land-man (Roger :-) strongly argumented against the use of ZOO.

I'm really sorry to say that I find NOTHING funny about the two sentences.
But I guess if I had been more mature and had english as my native
language I would immediately have understood that it was a joke, or?

: I guess a secondary rule will have to be: even though the entire context
: of a piece makes it obvious you are stating a personal preference or
: opinion, you'd better put phrases such as "in my opinion" in every
: sentence, or someone will accuse you of trying to tell them how to think.

Let me put it this way:
You are a well-known personality in the Atari-community. We all know that
personalities have great impact on 'the masses'. If I'm the only one not
to understand your joke then this is of NO relevance. But if I'm not
alone (and I do hope I'm not :-) then we're looking at something that
might pursuade people not to use ZOO (just because that great personality
Ian thinks it should be shunned ;-). People that convert that way are
of course droids with no will, but they do exist - even in the Atari-
comunity.

I hope you understand my point of view.

I've had this happen before with an intermittent power supply connection.
Perhaps your power supply is dying. The explanation is simple - it takes more
current to actually operate the floppy drive, so when the system tries to draw
more power and the supply can't handle it, total system voltage drops, causing
a reboot, and on and on...

This sounds wrong, the first 4 bytes of the memory map are part of exception vector 0, the reset vector. (Usually a jump instruction to the address stored in the next 4 bytes...) Of course, the reset address *will* point to the start of the OS, but still, not quite the same as the OS header.

From: sourada@iastate.edu
Message-ID: <sourada.735013093@vincent2.iastate.edu>
Source record: 39165

What kind of limit does the ST (not TT, Falcon) put on transfer rates from hard drives? Basically, I want to know if there is any difference between buying a drive that has a 3 MB/s transfer rate and one that has only 1.4 MB/s. If the ST limits transfer to (say) 1MB/s, then it probably doesn't matter...

(If it matters, I intend to use a SCSI drive, probably through an ICD adaptor)

Later,
Steven Ourada

2215. Misc. Replies

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-17 03:19:23 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C5LyKC.3HE@sdf.lonestar.org>
Source record: 39057

I'm really sorry for making multiple replies like this, but I read mail offline with a QWK reader but the UNIX side doesn't handle replies properly and I just don't have the time to waste on this net.

However, someone asked about compressing and archiving a directory with LHarc, and you should NOT specify a drive or a preceding backslash. A drive will cause it to be unpacked to that drive only, and a preceding backslash will cause the archive to include all the listed folders and they will be created in the ROOT of the drive. To avoid this, go to the parent of the folder you wish to compress (from a shell, or place LZH.TTP in this folder), and then use LZH A FILE.LZH FOLDER*.*
Use the name of the lharc in place of FILE.LZH the folder you wish to compress in place of FOLDER.

I highly recommend STZIP 2.1 for this though. It handles folders much easier and uses a really nice built-in GEM interface. Just click on Recursive subs to compress all your folders within folders. Its point-n-click.

-==-=-=-=-

I keep hearing about getting files from a.a through email, uuencoded. Can someone give me some pointers on this? Someone said to send a message with the message body of just "help" (no quotes) and I did but that was a few days ago, and I don't think it worked. I'm interested in MiNT, GNU C/C++, and the associated file that with these (MiNTLIB, decent MiNT/Unix shell, etc).

-=-=-=-=-=-

What is this Overscan I keep hearing about from a.a? Will it work on an STE? What can I expect from it as far as cost as resolution? (I use an NEC 3D).

-==-=-=-=-=-=
\\

Is MiNT IO still blocking? If so, when will this be fixed? Its hard to get virtual memory going without non-blocking io!! DMA access and file IO just blocks. That's pathetic!! It needs to be fixed, along with that pipe speed! We really need a decent well-written version of MultiTOS with a FUNCTIONAL VM.

-=-=-=-=-=-

I keep hearing about hard disk write caches, and read caches, are any of these pre-fetch? And do any of them specifically keep the FAT and directories in RAM so they don't have to be accessed continually. I'd like to see a
MiNT cache that used non-blocking IO to act as a cache that would write in the background using Malloc()s to keep the cache building on long writes.

---=-=-=-=-=-

I heard that I can upgrade my 1040 STE to 16Mhz just by pulling the 68000 and inserting a 16mhz rated 68000 in it's place, bending up the clock pin, and then jumpering it to the video shifter to get a 16mhz signal into it, and it will work without any other additional hardware. Can this really be true? If so, could someone give me details as to actual pin-numbers?? I've heard the speed would be like a MegaSTE with cache off.

-=-=-=-=-=-=-

Please repond in EMAIL, to evanlang@sdf.lonestar.org

Thank You much, and sorry again, I know how you hate new threads.

First off, I'll say that I'm virtually 100% ignorant on the topic. (Hence,
this question...:)

Why are you using (or do you want to use EMACS as your shell? I was/am under
the impression that it's a high-powered text-editor....(???)

Is it a GUI replacement for GEM? A CLI replacement for GEM, or what?

Emacs IS a HIGH-powered text-editor.
Thus it can be used as an editor, you can play games in it, you can run
shells in different *text* windows, compile in the background in one
window, etc. etc.

Note *text*, it is NOT a GUI replacement.

Erling

>
Excuse me, but I just can't keep from saying _something_. OF COURSE a 386 can move things around in text more 100 times faster than a Falcon. An XT moves text faster than a TT!! This is NOT because the 386 (or XT or wahtever) is moving PIXELS around fast--it's moving CHARACTERS around--slow. Whereas in text mode a DOS machine has to move ONE (1) byte per character, a TT (or Falcon) in 16-color VGA move has to move SIXTY-FOUR (64) bytes. This takes a bit longer. Of coures, if you put a DOS machine in graphics mode (i.e., running Windows), then it loses all its advantage and quickly turns into a dinasaur.

> Btw, didn't you know that the Falcon has hardware scrolling? And it's faster
> than any normal 386/25 ever is going to be....
>
This is not what you think it is. Hardware scrolling means you can shift the screen or parts of it a few PIXELS in some direction. Even the 8-bit Ataris could do this--it's a common graphics trick. But this does NOT imply that text scrolling is done by some peace of hardware. To scroll text, you have to actually move every byte in every line to the next line. No getting around it (without text modes, which DOS machines have, and ST's [or any other 68k machine I know of] don't have).

> Just tell me *any* graphic application that runs faster on a normal 386/25

2219. Installing G++

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-17 06:26:46 UTC
From: rdo@kynes.bison.mb.ca
Message-ID: <H.ea.viPGX2fi98E@kynes.bison.mb.ca>
Source record: 39171

I'm having some trouble getting G++ up and running. Been using GCC for a while without any problems. Recently installed GCC 2.3.3.

I went into /atari/Gnustuff/Tos/G++ on atari.archive. I didn't find any installation instructions, but the process looked simple enough. I improvized and downloaded:

g++233b.zoo into c:/gnu/bin
gpincl17.zoo into c:/gnu/include/cpp
gplibo15.zoo into c:/gnu/lib

I wrote a "hello world" program:

```
//: HELLO.CC - World famous hello world program
#include <iostream.h> // more comments

void main() {
cout << "Hello world" << endl;
}
```

and compiled it with:

```
gcc hello.cc -lg++ -o hello.ttp
```

and got the following error messages:

```
f:/tmp/cc1000001.o: Undefined symbol
ostream::operator<<(const char*) reference from text
f:/tmp/cc1000001.o: Undefined symbol
ostream::operator<<(ostream &(*)(ostream &)) reference from text
```

Obviously I've missed something when I installed G++. Anyone have any ideas?

There are 2 things that you could try, the DC power plug on the disk drive,
try repluging it, out and in a few times, the pins get corroded.

The other is to replace the Electrolytic capacitors in the Disks drives PSU,
Electrolytic capacitors dry out in switch mode PSU's, ie, they go open circuit.
so your 1000uf cap ends up about 20uf..

I have all ready done this with the 20 meg versions PSU, the one that looks the
same as a Mega file.....

Agreed! But he states `If we're talking about screen output of any sort, even
"text mode"'. Well, maybe I should have been a bit more specific in
my comment. I was referring to the graphical output.

I don't think you know how flexible the hardwarescrolling are on the Falcon.
You don't have to scroll just a few pixels, you can scroll in almost any
fashion you want. It all depends on how you utilize the hardwarescrolling.

On machines with enough memory, it is perfectly possible to use hardware scrolling to scroll text, you just have to know how it's done and do it properly. Ask any democoder...the falcon could scroll text vertically and use 1/25 of the CPU time that it does right now.

If Atari had wanted to serve its users, I'm sure it could've negotiated
something with DRI, to allow them to release MultiTOS for free, or
whatever (they could still sell the manual for $20).

After all, you already have to have a copy of GEM to use MultiTOS;
there's no way around that requirement.

Youl'll see one again the 1st of May. Sorry I didn't get one posted this month.

In the meantime, you can get a copy of the last one from the news.answers archive at pit-manager.mit.edu:/pub/usenet/news.answers/csas-faq, parts 1, 2 and 3. I believe there is also a copy at atari.archive, but last time I checked, it was older than the newest copy...

Later,

> This is (presumably) true - Eric Smith "should" know. But in all
>TOSes I've seen the TOS Version can be found from the third and fourth
>(Hex) bytes at the bottom of memory.

Yes, I do know. And yes, there are versions of TOS in which the TOS version is *not* at a particular fixed location in memory. A trivial example is given by any RAM-loaded TOS. The method I gave will work correctly for those (despite my misleading comment about "ROM"; in fact what I meant to distinguish in the comments was AHDI's copy of the OS header and the real TOS OS header, which is usually in ROM but could be in RAM if TOS is in RAM). Non-trivial examples also exist.

We document things like the location of the OS header pointer for a reason, namely so that people don't have to "guess" where things might be, and so that they don't assume that "if it works this way in TOS 1.x, it must work this way in all TOSes".

I used to use Flight Simulator II from subLogic on an Atari Mega 2. Now, I have Microsoft Flight Simulator 4 on a '386 notebook (I run MSDOS rather than Linux only when I am using Flight Simulator). For the Atari Flight Simulator, I had the additional European scenery disk. I have copied the only file on the disk (named F8) to an IBM-format floppy and played with it a bit, but have not found a way to get it to work with FS4. Has anyone else tried moving scenery disks across platforms and had any luck? Is this hopeless?

Thanks for any help,

David

Yup, there's even *simple* commands in STOS that will let you do hard-ware
scrolling. Quite fancy, about 5 lines of code can have 4-320*200 pictures
bouncing in & out of the screen at quite reasonable speeds!
(I think it's actually an STE module that adds the commands)

> just tell me *any* graphic application that runs faster on a normal
> 386/25 than a Falcon.

I have no idea what you mean by "normal". I suspect it's an attempt on
your part to pre-hedge against any answer I might give.

The answer, by the way, is simple: Cyber Paint and Autodesk Animator Pro.

Cyber Paint is a 16-color animation program that runs only in 320x200
mode. Autodesk Animator Pro is a 256-color animation program that runs in
any resolution on MSDOS machines. Ani Pro grew out of the Cyber Paint
source code, so it makes a uniquely valid comparison.

The 386/25 machine can play 256-color 640x480 animations faster than the
Falcon can play a similar (in terms of deltas) 16-color 320x200 animation.

When I tried to port Ani Pro playback to the Falcon, so that I could do a
truly direct comparison between the two machines using the exact same
animation file, I couldn't get any better than 3 frames per second on the
Falcon for an animation that will play at 30 fps or better on the 386/25.
(And I have been a 680x0 assembler programmer much longer than I've been a
80386 assembler programmer, so I don't think quality-of-implementation had
as much to do with it as you might think. The problem, quite simply, is
the Falcon's brain-dead interleaved bit plane scheme for storing pixels in
256-color mode. If the Falcon supported byte-a-pixel (aka packed-pixel)
video memory layout, I have no doubt it would run circles around the
386/25 machine.)

Yeah. Democoders do amazing things with graphics. They impress the hell
out of me, for all of 30 seconds or so.

But those amazing demos don't bear any relationship to real-world
applications. There's a world of difference between creating a demo that
can run a hand-coded animation at 30fps, and writing an application that
lets you create and then play back any aribitrary animation at that speed.

> You are a well-known personality in the Atari community.

No, not at all. I am, perhaps, a well-known name in the community, although I consider that to be debatable. Y'all are just barely getting to know my personality. I think many don't like it. Tough.

I'm opinionated. I play games with words a lot. I love arguing just for the sake of arguing, long after the main point has become moot. I'm brash and obnoxious. I am, when it comes right down to it, pretty misanthropic.

On the plus side, I know a lot about computers, mainframes and Atari especially, and I don't mind sharing what I know. I also think it's a fun thing to create software and give it away for free.

Y'all will have to decide for yourselves whether you think the pluses and minuses balance out. But whatever decision you reach, keep it to yourself, I don't really care.

Actually one wouldn't need to be a democoder to do such a thing. One
would 'only' need to be a C- or assembly-programmer. :-)

The actual implementation would be simple as hell IF and ONLY IF things
like MultiTOS and graphic-cards wasn't around. Just use the double-buffer
technique (probably invented by TCB once upon a time) and scroll by
increasing the screenbase-address. I think this is the technique once
used in the scroll-routine for fasttext under MiNT...

However, things have changed and we don't want hardware-dependant
programs anymore (unless they are presented in a DEMO, which is a whole
different thing).

Try to keep the nice demo-code-routines where they belong, in DEMOs!

Just curious - what about the Gnu C Compiler (GCC)? I'm not sure,
just asking. I suppose another question would be if there's a difference
(in practice) between an ANSI "certified" C and an ANSI "compatible" C?

: Yeah. Democoders do amazing things with graphics. They impress the hell
: out of me, for all of 30 seconds or so.

That long? ;-)

: But those amazing demos don't bear any relationship to real-world
: applications. There's a world of difference between creating a demo that
: can run a hand-coded animation at 30fps, and writing an application that
: lets you create and then play back any aribitrary animation at that speed.

Of course there's a "world of difference" between the two. The "arbitary
animation" will look like crap compared to the hand-coded one. Before
I get tons of flames from you Ian I might add that it's NOT because the
democoder is better than the application-writer. It's most often (note,
not always) the other way around. Writing the application is programming-
wise a lot harder and it can not be compared to hand-coding an animation.
However, to get the very last cycles out of your processor does require
you to be a rather good programmer, don't you think? While the application-
writer proves to be a good programmer by writing the application in the
first hand, and then by optimizing it to gain speed the democoder proves
his abilities by squezing that last cycle out of the processor before
the next VBI.

The reason why the "arbitary animation" will look like crap compared to
the handcoded one is that whatever you do you will get lots of overhead.
The only way to get around the big overhead is by pre-calculating parts
of the animation, and that's just what the democoder also is doing...
(which could imply that if the application produced good output the
programmer could be a good democoder if he only tried :-)

according to Webster's:

ar-chive n., 1. a place where documents and other materials of public
or historical importance are preserved.

in the world of computing, archives have a similar meaning. only *most*
people i know of want to be able to access the archive data in (at least)
two important ways: 1) from other currently accessible systems, and 2) far
into the future.

a true "thinking person" will immediately *require* the minimum attributes
of an archiver:

1) portable source code (so porting can be accomplished). i don't
know about u, but i doubt i'll have an atari in 10 years, but
i'll still want to get at my data.
2) identical behavior on all platforms to which the archiver can be
ported. this includes version control (version x on platform
abc should work the same on platform xyz). this implies that one
person or group controls it (eg POSIX for tar, rahul dhesi for zoo,
SEA for arc, etc).
3) must make the aggregate archived data smaller in size than the
original data. how much is of relatively little importance since
today everything available is within 50% of each other.

1) is reasonably satisfied by code written in ANSI C (that's why we have the
standard in the first place). i won't even think about C's future replacement
as a language (it is supported on most systems available today and will
likely be supported for at least 10-15 years).

beyond these, everything else is convenience and to some extent fluff. this
includes packing density (convenience), speed (convenience), GUI (fluff),
directory support (convenience), support for tiny systems, eg floppy-only,
small memory from 5 years ago (convenience), etc.

based on this, i would offer the following evaluation:

zoo 2.1 source freely available, 100% ANSI C, supported by
many platforms (TOS, MS-DOS, unix, VMS, etc), stable,
controlled.
lharc of the myriad variants, the lha 1.00 code is good
enough and competetive with zoo 2.1 (note that this
does NOT include the so-called "Questor" lharc which
is written in 68k assembler). i have had good luck
(so far) with lha. still a "moving target" but better
than it was 6 months ago.

tar source freely available (GNU), 100% ANSI C. needs a
compression program to either compress the individual
files (bad) or the entire archive (good, but has
naming problems with 8+3 systems)
compress very stable, source freely available, has been the
standard for unix. only compresses single files.
GNU zip the GNU replacement for compress, source freely
available. only compresses a single file (ie is not
really an "archiver").
zip many (incompatible) versions (i have recently posted
ST .zip files i can't unpack with unix unzip, though
all MS-DOS .zip files i have found can be unpacked
with unzip)
arc 5.21 super stable, limited features (no directories), "old"
performance (huffman), source freely available
arc 6.02 no source (hence unacceptable) but does solve the
lack of directories

right now, i'd say my personal choices for "universal" archives would be (in
order): zoo 2.1, arc 5.21, tar/compress, lha 1.00, tar/GNUzip.

i put arc high in my list since about half the stuff i have on long term
storage (floppies from 5 years ago) is still .arc files and because the
general trend is for storage space gets cheaper/larger computers get faster.
i would consider lha 1.00 as a 1:1 equal with zoo except that i think it is
far less stable (which i define as too many new formats too quickly - ie it
is not managed well). i mostly use tar/compress for source code trees (ST and
unix). i am debating what impact GNU zip will have. the fact that they picked
.z as their suffix (which, on file systems like TOS which are case independent,
conflict with compress's .Z) makes it ambiguous (it also conflicts with
system V unix's pack(1) command which uses .z).

flame away (roger, ian), but think first...

2245. Cookie Jar problems with TOS <= 1.02

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-18 04:49:15 UTC
From: John_Collis@equinox.gen.nz
Message-ID: <John_Collis.dx1x@equinox.gen.nz>
Source record: 39094

I've just discovered a rather awkward bug about using the cookie jar with
TOS <= 1.02.

When installing a new cookie into the cookie jar, the accepted way is to
first check whether _p_cookies (5A0 in hex) is pointing to anything or not.
If so this is the cookie jar, if not assume you are running on a TOS
without support for the cookie jar (i.e. <= 1.02) so install your own.
This works fine on a cold boot, BUT!! if this is a warm boot the value
at address 5A0 hex is NOT cleared under these versions of TOS and
potentially can point to anywhere in memory that last had a cookie jar
installed. If the installed a jar was either a program's own address space
or by using Malloc(), that memory is completely undefined in terms of what
could be there now.

This is obviously a problem for a AUTO folder / Accessory pair which use the
cookie jar to set up a communication channel.

Any suggestions or comments welcome.

Well. Why bother? Eric should know. What you have posted indeed works,
but not because $4f2 points to $2 (it never did), but because the
first 4 bytes of memory are a shadow of the first 4 bytes of ROM.
However, the OS doesn't have to be in ROM, that's why there *is*
a pointer to the OS header.

So please forget this sample code!

It's much more obviously a problem for a reset driver, as Atari tells us.
Just clear the pointer before jumping to the old reset code.

Actually, this has to be done for any TOS before 1.6...

Well, I don't know what was wrong with the version at atari.archive, but
I managed to get another version from a German site. Installed it, and
it's running fine.

Now, let's see if all the noise about C++ is true...

] The answer, by the way, is simple: Cyber Paint and Autodesk Animator Pro.

Are they both compiled with the same optimisation levels etc.!?

Newer programs usually have tidied codes, and Cyber-Paint was hardly
intended as a multi-system program!

Compare things such as True-Paint and something similar on the PC, they
are recent, and are made to be multi-resolution etc.

Comparisons are pretty daft any-way, no two programs will be the same
speed, even if both machines are 16Mhz, running in 640*480*256 mode!

Different architecture, and different programming produces different
program, 'benefits'.

What program are you using to capture the output of the TG-55? If it
is home grown, are you aware that the standard input buffer size is
128 bytes, and that you'll have to read the data out fairly rapidly
to avoid data loss? (Another alternative would be to set a larger
input buffer).

> 2. The MIDI receive interrupt is at the same level as the keyboard/mouse
> handler. The latter often takes a long time to run, during which the
> MIDI port cannot interrupt the CPU. Therefore, even if your code which
> reads the MIDI input queue is efficient, MIDI overrun can occur.

This is true, if you're moving the mouse. Two quick solutions would be:
don't move the mouse during receives, or send the IKBD a message to
disable the mouse temporarily.

> The second problem is more difficult; the ST cannot cope with full
> bandwidth MIDI input :-(

This is just plain wrong. And on a machine that's been around for 7 or
8 years, I'm surprised to see this kind of misinformation being spread
around. One easy method (as mentioned above) is to reset the IoRec to
a larger input buffer. This will work up to 32 kB. Another way is to
read the data out quickly. This will work even with a 128 byte buffer.

But notice I said *quickly*. If you use the Bios-level calls to check
for and read in data bytes, you will lose in a big way, because they
have a huge amount of overhead... approaching 1 mS per call. Vector
intercepts from the AUTO folder can slow things down even more. So
in the time it takes to test for and read in one byte, 5 more have
arrived.

At full MIDI data rates you have only 320 uS to grab each byte, on
average (you can be slower for some bytes because you have the 128
byte input buffer to back you up). So you *have* to bypass the
Bios, or go with bigger buffers (actually a much simpler solution
if you're just doing simple data capture).

I *know* this is possible because I've done it. My Omni-Banker ST
universal MIDI librarian can handle full speed dumps of 14+ kB from
an RX-17 drum machine, which runs at 98-99% max MIDI data rates,
with no loss of data and using just the standard 128 byte buffer.
And it's written in Pascal (no assembly required), just carefully
written Pascal. And it's been running very successfully on all
sorts of ST's with TOS 1.0 on up, since 1987.

[I just picked the RX-17 out of the air because it's one device
I know that runs at max MIDI bandwidth. Lot's of synths don't, with
some running as slow as 30-40% of maximum (the FB-01 comes to mind).
There are other instruments that dump more than 14 kB at once, but
I haven't metered them to see how fast they're doing it.]

> I believe that Cubase and others get around this by
> installing their own faster keyboard/mouse handlers. I have never
> had problems getting large memory dumps into Cubase.

This is also true, but then, Cubase pokes its sticky little fingers
into all kinds of vectors.

> [My analysis is based on STs running 1.0 to
> 1.6, I have not tried TOS 2].

My *experience* is based on over a thousand ST's/TT's running TOS 1.0
to 3.06.

[...]

However, since GNU zip does support decompression of both COMPRESSed
and PACKed files there shouldn't be much of a problem. The only problem
I see is if the downloaders of your program don't use gzip. Since FSF
have changed from compress to gzip in the GNU-project, I think we all
should try to throw those old compress-programs out the door.

For those who haven't noticed it yet, GNU zip supports the Atari-line of
computers directly in the sourcecode nowadays. The latest version can
always be downloaded from your local GNU-supplier, or if they haven't got
it, from prep.ai.mit.edu by anonymous FTP. If you don't have the resources
to compile it yourself the executable files have been (and will be) uploaded
to atari.archive.umich.edu, ftp.uni-kl.de and ftp.cs.tu-berlin.de.

At the moment gzip does not handle both long multiple-dot filenames and
normal 8+3 filenames in the same executable. This should change in the
near future. In the meantime there's two different programs to fill
all needs. One that correctly follows the 8+3 rule, and one that happily
adds a .z suffix to whatever filename you feed it (works great under a
Minix filesystem :-).

Happy packing!

> Just curious - what about the Gnu C Compiler (GCC)? I'm not sure,
>just asking. I suppose another question would be if there's a difference
>(in practice) between an ANSI "certified" C and an ANSI "compatible" C?

Good point.

Of course, the issue may be the fact that ANSI isn't an organization
that's in the business of certifying ANYTHING... They just make
standards. There are some laboratories out there that are in the
business of "certifying" compliance to ANSI (Bicycle helmets come to
mind - there's labs that test compliance with ANSI and SNELL (?sp)
standards for bicycle helmets.) but it's not clear that there's labs
that do this for C.

As near as I can tell, NOBODY actually certifies the C compilers (at
least not authoritatively); it's the manufacturers that claim ANSI
compliance. And if they can be proven wrong, then ANSI can sue their
pants off if they don't fix the problem. But it's mostly market
driven.

I'd like to write a conservative Garbage Collector for LPR-Modula-2.

But for this, I need to find the 'roots'.
Which are: registers, stack (locals) and globals.
The registers and the stack are easy to find, but the global variables
are spread all over the modules (each global variable is attached to
its corresponding module). I know how to find the end of the region
for global variables for each module, but not the beginning.

Does anybody know where I could find this kind of precise information
about the modules-organisation ?

Or better, how to get the sources ??

OK, let's try...
What kind of process is it that waits for the keyboard.... ?
IO-bound, you bet !

It should get a high priority, then !

> m> This makes for good interactive response because I/O bound processes are
> m> generally those that are interactive. They get most of the CPU time and
> m> soon become CPU-bound, so their priority falls.
>Again, on a multiuser system that is likely to be the case. Prioritizing
>I/O bound processes on a single-user system is likely to lead to things like
>database reindexes, compiles, spellchecks and the like monopolising the
>system, and degrading its response time to an unacceptavble point.

The unix-way of doing it can be parameterized, so that
keyboard-IO-bound processes get even higher priority than
disk-IO-bound (if necessary)

>\`miff` /|\

The bad response time you sometimes get with unix is generally not due
to multitasking with a bad scheduling policy, but to virtual memory,
because while a process is waiting for the keyboard, it is inactive
so that it tends to be paged out !
This is a serious problem, not yet solved !

But doesn't apply to MultiGEM or MiNT (for the time being)

>which were definitely the 'wait-stated' units.

...

In this case I'm just playing with semantics, but from the
history of the Falcon, it isn't true that "production Falcons"
are not "wait-state Falcons". According to the reports we got
on the Net, Falcons were sold in Europe to the public last
year, in the state that Ian's was. Maybe "wait state" Falcons
won't be sold widely in North America, but if they were "produced"
and "sold to the public", you can't call them "pre-production".
All we can do is hope that this is all true an that your "rev. 4?"
Falcon really is something different at all.

>facts not fiction..

That's an interesting fact that you propose; all of the Unix boxes that are purported to have disk drives attached to them must be fictional then. And the device drivers in the Atari BIOS for disk drive devices that get mapped to things like /dev/a, /dev/b, /dev/c, ... /dev/p must all be completely fictional too.

"Doesn't support disk drives..." Supporting general output devices obviously isn't good enough - you must want archivers have special code to restrict them to use with the devices Atari designed back in the early '80s.

>Unless a Archiver has full output direction it is completely useless to
>most Atari users, another fact...!!!

Which direction were you thinking of? Up? Down?

Zoo can redirect output to lots of places, including pipes. Stick THAT in Lharc's "pipe" and try and smoke it. Actually, lharc might support pipes too. I seriously doubt that zip does, though. And I still haven't found a version of zip that I can run consistently without it bombing. That being under GEM. It just ain't reliable.

If you're not clear about the nature of your complaint, it tends just to sound like so much raving.

>I did not thing that any one used the ANSI C Standard, is that why am
>I reading about all these patches to MINT for the different C
>compilers..??

No, the reason why differing C compilers require slightly different coding is that MiNT contains code that lies outside the ANSI C standard:

- CPU dependent assembly language code because C does not define a "standard assembler" (That would require that C be restricted to running on one particular CPU)
- Atari dependent libraries (for things like BIOS/device driver support), which lie outside any C standards.

MiNT is necessarily somewhat non-portable by its nature as systems software specialized to the Atari ST.

We aren't interested in what it does on Unix. We are talking about PLAIN GEM desktop usage on an ATARI! Without a desktop-replacement, or TOS version 2.xx or higher, ZOO will not redirect on an ST!

(Apparently with 'unselected window booting' it will work on TOS 1.4 or 1.6, but I have yet to see this tried).

] Zoo can redirect output to lots of places, including pipes. Stick
] THAT in Lharc's "pipe" and try and smoke it. Actually, lharc might

Source record: 39111

What if there was a computer, based around the 68030, that was faster than the Falcon, had more color capabilities, better sound, a 32-bit system-wide bus architecture, and was backed by a company many-fold better than Atari that would support the user and computer like the users would want? The only problems are that this system is new, thusly having only a few pieces of software to begin with, a new GUI OS (therefore, new software has to be written for it), and it's not compatible (except in the generic details like ASCII, RS-232, parallel port, etc.) with other systems currently made. As well, it cost from $1500-$2000 (without monitor).

Would you be excited? Would you want one? Would you consider buying one? Would you go out and buy one?

I don't know any significant differences here..

>MNP5 and v.42bis

MNP5 is not as effective as V.42bis. V.42bis is said to have a max.
pack ratio of 4:1, while MNP5 has 2:1. However, I have tried with a
2400/V.42bis connect and downloaded a 100KB textfile of straight A
letters, it came ~1920 CPS = 19200bps.

MNP5 isn't as intelligent as V.42bis either, it can even slow
transfers (so I heard) if you transfer packed files (eg. ARC, LZH,
ZOO, ZIP), as it tries to pack the data but doesn't succeed. V.42bis
doesn't have this problem. MNP5 also causes text to display in rougher
chunks than V.42bis.

>UUCP mail? If anyone has any info please leave reply or leave me e-mail.

Mercury-Uucp from Rodney Volz. No longer supported.

HERMES from Martin P. Ibert <martini@cloud9.in-berlin.de>. It's shareware
and can be found on several FTP-server.

The two mentioned archives are packages an have all you need. The last
possibility are programms that follow the `Hamburger Standard'. This is
the version I'm using. Therefore you need the following:

- Mailreader (ELM or BLM)
- Newsreader (NN)
- Newssoft (mnews)
- Mailsoft (smail 2.5)
- Transfersoft (GFA-Bugsic uucico [the same used by the above
mentioned packages] or Taylor-Uucp)

The NN, smail 2.5 and Taylor-Uucp can be found on
wowbagger.pc-labor.uni-bremen.de [134.102.228.9].

The newest version of the GFA-Bugsic uucico can be ordered by Lutz Petersen
<lp@shlink.hanse.de>.

Hope that helps,
Alf

>
>Unless a Archiver has full output direction it is completely useless to
>most Atari users, another fact...!!!

portability implies that a program should NOT have its own GUI interface
because there is no universal GUI (with the possible exception of curses).
Unix systems don't run GEM, and PCs (generic) don't in general run X. IMHO,
archivers should have command-line interfaces only. GUI interfaces on
specific platforms should be provided by driver programs (eg arcshell or
whatever). surely a GEM driver program for zoo, lharc, zip, arc, tar, etc
can be written to handle all these scenarios you constantly bring up. the
implementation details should not cloud the basic issue of portable archives
themselves.

>I did not thing that any one used the ANSI C Standard, is that why am I reading
>about all these patches to MINT for the different C compilers..??

ANSI is a standards body recognized internationally for all computing (not
just unix). the ANSI standard for the C language (per committee X3J11) has
defined a standard for the language that makes it possible to compile programs
unchanged on compliant systems. all serious programmers use ANSI C (or they
risk non-portability). while a weekend hacker on the ST may not care much
about portability, more serious people like Fortune 500 companies, the
US Government, etc (ie the "real world") do. this is not limited to the US
(there are international organizations like ISO which have similar goals).
since i regularly interact with both government (mostly DoD) and business
(most fortune 500's), i know what they want.

the implementation details of ANSI C are independent of the standard itself.
MiNT is patched to make it more ANSI and POSIX compliant so that codes can
be ported more easily to the ST platform (which should make it more useful).

note that ANSI C says nothing about a GUI interface. if they did, i am quite
certain they would not make it GEM :-).

i would think it is certainly in atari's and atari developer's interest to
make programs which could be easily ported from/to other platforms. making
everything a GEM program severely limits this in the long run. unfortunatly,
there is no universal GUI (yet) and it is highly likely that atari itself
would rather fight than switch...

ciao

>video memory layout, I have no doubt it would run circles around the
>386/25 machine.)

Here is a typical case of a blind port. If Ian used the Falcon's TrueColour mode, his prayers would be answered. The TrueColour mode is 1 word per pixel.

As this is a tech group, I'd like to re-raise this point about types of video memory layout.

Basically, there are three common types of video layout:

1. Bit interleaved bitplanes.
2. Word interleaved bitplanes.
3. Bitplane interleaved bitplanes.

These mean:

1. Bit interleaved bitplanes.

Bits of a pixel are adjacent in memory. For example, 1 byte per pixel means all 8 bits of a 256colour pixel are in one byte [eg. ModeX on VGA cards]. 1 word per pixel means all 16 bits of a 65536colour pixel are in one word [eg. TrueColour on Falcons]. 2 pixels per byte means all 4 bits of a 16colour pixel are adjacent in one byte [eg. GTIA modes on 8bit Ataris]. 4 pixels per byte means all 2 bits of a 4colour pixel are adjacent in one byte [eg. graphics mode 7 on 8bit Ataris]. Got that yet?

2. Word interleaved bitplanes.

Bits of a pixel are in corresponding positions in adjacent words of memory. For example, in a 16-colour mode, the bits for a pixel are at the same bit position in 4 adjacent words of memory [eg. ST Low rez].

3. Bitplane interleaved bitplanes.

Bits of a pixel are in the same position in completely
separate bitplanes (expanses of memory). For example,
in a 16-colour mode, all the first bits of pixels are
in one area of memory, followed by all the second bits
of pixels, etc. [eg. Standard Amiga graphics modes]

Now, to say that one system is better than another (or to say that one
is more "brain-dead" than another) is pure naivety. Each style has
greater and lesser consequences.

One of the greatest advantages of (3) is that you don't have to use all
the bitplanes. (2) also has this advantage, but has the added advantage
that when you do use all bitplanes, access is still very fast (because it
is still local).

The big advantage of (1) comes when using pixel-based operations (such
as lines) rather than raster-based operations (such as sprites & blits).

It is only logical that "business oriented" machines such as PC clones
focus on pixel-oriented modes, while "games oriented" machines such as
Atari and Amiga use raster-oriented modes.

The Falcon gives you the very best of both worlds - word-interleaved
modes right up to 8 interleaved bitplanes, and a 16-bit (word-per-pixel)
bit interleaved mode.

IMO, you can't ASK for much more than that (except extremes like 24-bit,
32-bit), but Ian would complain about those too ("Waaaaa, you have to modify
4 bytes just to change one pixel!")

Bo: I can tell you that, at the least, the 1040STe has the following,
which are different from the older 1040's:
-blitter chip
-newer TOS (v1.06 at least)
-digital sound hardware
-funky joystick ports that have never been used, to my knowledge

Much of the hardware is the same, to the best of my knowledge.
Oh yeah, one more thing: the STe uses SIMMs

>a reboot, and on and on...

When I read the original article describing the reboot problem I wanted
to reply but had useful information to give. This explanation here from Howard
is very valid and prompted my attention. I have had a number of people with
Mega's (mega 4s) come to me with blown power supplies. One fellow even had his
entire mega trashed when his stock supply died (it produced nasty spikes that
killed a bunch of chips). The supply in the mega is a cute little switcher but
it isn't quite large enough to power all the chips (thats a lot of RAM in that
machine for that supply). I would suggest disconnecting the floppy and boot
from the hard disk, if it works then you know there is a floppy problem. I like
Howard's comment because it is consistent with my expereinces and it is not
something I sould check right away (I would zero in on the drive first). The
solution is to put a heftier supply in your mega, or adapt and external supply
with a power jack. Remeber, one person has reported his supply totally killing
his mega. Beware.

Sorry Bill that I had to cut this up, this system will not let you reply
only a few lines and leave the article intact..

How come you are all for CLI's and use Ataries, would not a PC clone
fit your needs better...:-)..

Or may be a Amiga...;-)..

I here that this network (CityNet) that I use here in New Zealand,
has been mentioned by U.S. Congress, that we are doing a good thing, I think
that the script was posted to nz.general...!!!

I do have a copy of it...

Bye for now..

Roger..... sheppard_r@kosmos.wcc.govt.nz

>a larger input buffer. This will work up to 32 kB. Another way is to
>read the data out quickly. This will work even with a 128 byte buffer.
No, it is not misinformation, I stand my what I said. As you know, the
machine comes with MIDI ports built-in, and also has a graphical user
interface. However, you have to either rewrite parts of the operating system,
or you have to disable the mouse and lose the user interface ***at any time
that you might be expected MIDI input***. In some simple programs (eg the
TG-55 dump program that started this thread), disabling the mouse is quite
probably not a problem. In many non-trivial applications it is *NOT*
a solution.

Bypassing the BIOS to read the queue does not solve the problem of overrun,
whereby one MIDI byte arrives before the previous one has been read by the
Interrupt routine.

2276. Re: Silly question about Sversion()

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-19 08:43:23 UTC
From: cjr@cs.bham.ac.uk
Message-ID: <C5q2wB.JEt@cs.bham.ac.uk>
Source record: 39124

A quick interpretation question about the TOS version:
a value of 0x0104 is regarded as TOS 1.4 but
a value of 0x0206 is regarded as TOS 2.06, and not 2.6

What is the proper way to interpret the TOS version word?

Just curious...

Any program that installs a cookie jar has also to install a reset handler
which clears _p_cookies. This is 'even' documented in the original cookie
jar docs (STE TOS release notes).

What would interest me is how a Falcon compares to a 486 (e.g. 25MHz or
33MHz) system on gcc and/or TeX. Preferably with the 486 running Linux. Is
there anyone around that has experience with this? Or could run one of the
standard LaTeX files through these machines?

No! the reset vector address begins at the 5'th byte i.e. is a
long* at memory address 0x4. In fact, it comes immediately after the TOS
signature. I have compiled many programs that do warm starts based on this.
Check it out. I am reliably informed that the RESET address
MUST be at address 0x4 for ANY 68000 machine - it is (I am told) one of
the rules for the usage of this chip's mnemonics. As I have only used
Assembler very occasionally - I cannot defend the why's and wherefore's
of the last sentence.

>What is the proper way to interpret the TOS version word?
>
Just my guess - but surely there is no "proper" way to interpret
the info. The disparity between the two oft-heard versions 1.02 and 1.2
for the same TOS surely arises if you i/ either read the 2-byte TOS into
a (short) or ii/ as two (unsigned) chars.

Case i/ A would be printed out

printf(" Tos_Version= %x\n", tos_short); /* or similar*/

and naturally displays the number 102 for TOS 1.2 (or 1.02).

Case ii/ Two unsigned chars would allow you to insert a decimal
point and one would normally have

printf(" Tos_Version= %x.%x\n",toschar[1],toschar[2]);

and naturally this would omit the leading zero and display 1.2 (now
including decimal point).

If Atari should "decree" the "proper" version should read 1.02
then use

printf(" Tos_Version= %x.%02x\n",toschar[1],toschar[2]);

( Note Version 1.62 would be the same in both these cases ).

Hi,
I have a Mega ST 2 with a rev 5.0 motherboard that I would like to upgrade to 4 megs, _on the board_. I can't use an upgrade that plugs into the shifter. The spots for the 16 chips are on the motherboard, currently all filled with solder. Could someone tell me what types of memory are best for this situation, and what other changes need to be made to the board? If there is a document out there already describing this, please direct me to it.

Thank you,

Michael Kieras

Well.

First of all, you can't get more than 320 * 240 in 16 Bit Color (on a normal VGA monitor). Then: interleaved formats make things slow: the video system has to fetch 16 bytes for one pixel. It might be true that the interleaved format is suitable for games (but I guess that most DOS game programmers will disagree). This doesn't explain why there is no optional pixel packed 8 bit mode.

If you've seen NVDI running on a Crazy Dots graphics card (in 8 bit color), you know what I mean.

Since the related STE TOS versions are 0x0106 and 0x0162, should we
agree to squeeze out the initial zero after the decimal point? So it
is TOS 1.4 not "1.04", 2.6 not "2.06", usw. TOS 1.0 is still TOS 1.0
however.

Sorry to be pedantic! I just felt we should _really_ know what OS
versions there were...

2287. How to find palette size when > 32767 ??

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-19 17:43:13 UTC
From: timg@emx.cc.utexas.edu
Message-ID: <1quobhINN3b2@emx.cc.utexas.edu>
Source record: 39138

Hi,

A couple of diligent (or perhaps just desperate) ghostscript users have traced down a problem in the atari screen driver which causes blank screens to appear on some machines/configurations. Unfortunately, I don't know of any clean way to fix it. Here it is:

The screen driver figures out the maximum number of colors by looking at the size of the palette in work_out[39]. Unfortunately, it seems that this array element is zero if the palette size is greater than 32767, leading GS to think that a $1000 graphics board (or a falcon) is capable of displaying NO colors. Thus, a blank screen.

Can anyone tell me how to handle this situation is a semi-clean fashion? If there is no way to get this info through the vdi, is there a standard environment variable that 3rd party boards (software) install to inform the rest of the world about the board's capabilities?

Thanks,

-Tim Gallivan

>
>Full speed?! Nice! Okay, this is very helpful, thanks!

But do remember that this was ultra-packable! You will never get that
kind of pack ratio on real-life files. I'd say that if you get the 4:1
ratio you are transferring a very loosely typed text file, or some
data file with repeating structures.

>Now, does anyone know the difference between MNP4 and v.42?

Well, I can say what I have heard, I am not sure about this and that
is why I didn't want to post it. I heard that they are, to the user,
almost the same. I don't know about technical details, but they both
do the job as well. I also heard that MNP4 would have less overhead
than V.42bis, thus raising the CPS-rate by a _very_ little amount if
you only use the error control. My guess is that the difference won't
be more than a second with a 100KB file.

Anyway, why do you want to know? Are you pondering on whether to buy a
V.42bis or a MNP modem? In that case you might like to know (if you
didn't already) that every modem with the V.42/bis protocols also have
MNP. At least every modem that I ever saw/heard of. I even think MNP
1-4 is integrated in the V.42 protocol.

There is a nice version of zoo where you can simply say 'zoo ah//
zoofile directory', and zoo recursively packs everything in that
directory. I think it is one of the first versions which were ported to
the ST using gcc.

I can highly recommend zoo, as I have had the fewest problems when
transfering files between SUNs, PCs and my Atari ST when using zoo -
opposed to, e.g., lharc.

Hm - atari.archive and many other sites I know use zoo for big parts of
the archive, eg. most of the GNU stuff. Could you name some of those BBS
sites ? what's the problem using zoo ?

s>Its nar imposible to redirect the out put..

As zoo is compiled with gcc, it uses the normal standard output and
standard error channel for messages, which can be redirected as easy as
any other gcc compiled program can be. If you are having problems, you
should check if the problem is caused by the shell you use.

s>I think sticking to LZH201L or the New STZIP 2.2 will be far better,these
s>do work on small 520k one drive ST's...

Don't recommend lharc - there are much too many incompatible versions
around - I use zoo with no problems to exchange files between SUN, PC
and ST, which does not work as well using lharc (the new versions are
better, but you don't know what version other people have, and try to
get a lharc-2 on a sun).

STZIP 2.2 is fine - high speed, good compression. There is a bug in the
dialog handling, but that does not disturb if you call it via command-
line, plus it has a comfortable menu-driven interface build-in.

I use STZIP to pack most program archives where I am sure that I will
only need them on the ST, and zoo otherwise.

s>Take it from some one thats tried them all....
Me, too - and I can't understand why anyone should have problems using
zoo.

Hi freaks,

I've got a ATARI TT and a MAC emulator spectre, which doesn't work at all
with this type of computer. With my old ATARI ST there appeared no problems.
Description of the problem:
After the start up of the SPECTRE system program, the system stops during the
effort of loading the MAC system irreversibly: Booting is the only way out!

Who can help!

Many THANKS!!!!!!

P.S.: I tried a SPECTRE of the newer type with my computer: Same problem!
P.P.S.: The distributer of the SPECTRE only said: We can't solve your problem,
each TT is different (HaHa)!

>> ANSI certified compilers for the ST...
> I meant ANSI compliant.

Oh, that's very different. Leaving aside any quibbling over bugs that might cause not-quite-perfect compliance, I know of two ANSI compilers for the ST.

There's GNU C, which is free. There's Lattice C v5.5x, which is roughly US$200 (I forget the exact price).

In terms of comparing the two, it is my opinion that you get what you pay for.

While I see the advantages of not having hardware dependent programs,
don't you think it would be a neat idea to take advantage of the hardware
when it's available? Otherwise, in your perfect universe, the hardwrae
NEVER GETS USED. Rather pointless. Better is something that takes
advantage of what's there and boots performance, but still works without it.

Not as long as there's also code which makes the kernel work on all
kinds of different hardware, and that the kernel behaves in a well-
documented way towards any application running on top of it. :-)

2297. Falcon vs. 386: this has become pointless

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-19 21:38:04 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Apr19.213804.13487@mnemosyne.cs.du.edu>
Source record: 39047

I recently mentioned my liking for "arguing even after the original point has become moot." Well, in regards to this 386 vs. Falcon debacle, that point has been far exceeded. An argument, to me, is a reasoned discussion of differing points of view. We are in danger of losing any semblance of reasoning here.

Someone mentioned some not-wholly-accurate facts about the Falcon. I added my attempts at clarifying some of those things, based on personal observations and experience. I have a 386/25 system and a Falcon 030 sitting right next to each other here on this table. I wonder how many other folks making such emphatic-sounding statements about the two machines can say the same? Not many, I'll bet.

Y'all please continue your religious arguments about how much better the Falcon is than any PC-compatible machine on the market. Please go out and buy a Falcon or two for yourself, it really isn't a bad machine. But when you find that its performance isn't quite up to what the fanatical Atari-or-die fans have lead you to believe, I'll quite happily tell you: I told you so.

In the meantime, I thank whatever mysterious forces may actually drive this universe for the KILL command in newgroup readers.

>can't get the gemdos Sversion() function to return my TOS version number. I
>have an STe, with TOS 1.62 according to several other programs. What I want
>to know is, how can they tell?

Well, as you might have read in the FM, Sversion() returns the GEMDOS version number, NOT the TOS version.

>I would quite like to know, as I'm writing stuff for different systems and
>need to know little things like whether I can use the extended file selector
>etc... I don't have access to any other TOS versions to see what this call
>returns on them.

And that's exactly why the OSes have different version numbers for different parts of the OS.

If you want to know whether or not to use an AES feature, inquire the AES version from your global AES parameters array.

For GEMDOS, make the call and see if you get an EINVFN error return code or not.

For XBIOS, make the call and see if you get the function number back. Otherwise, the call has been sucessful.

For VDI, there are no difference. A GDOS inquiry procedure exists, though. vq_gdos().

Any questions? - Peter

STs are limited to about 1400 KB/s. Results may vary slightly, early units seem to be a bit slower, some users of newer machines reported 1500 KB/s with a fast Quantum drive.

Well, order a TT with 1.44 meg hard drive, TOS 3.06 and AJAX floppy controller chip. That's what Atari changed for the latest model.

2304. SUN *.au Sample format player/converter?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-19 22:17:12 UTC
From: markjl@bu.edu
Message-ID: <116049@bu.edu>
Source record: 39049

Hello fellow technical inclined Atarians!

(Always beware long salutations!)

(And too many exclamations!!!)

I'm wondering if anybody has tinkered or knows anything about the *.au sample (8 kHz, I believe) format that exists for the SUN series/make of computers.

Why?

Because I want to play some *.au files on my Atari Mega4ST. And I would be willing to try to get myself up to a decent level of hacking this thing out if I can get some advice/insight on how to do it __OR__ whether anybody out there has already done it. (Then I'd like to get the executables)

Aok, that's my scenerio. Please e-mail replies unless your response merits Usenet bandwidth for this newsgroup -- and if you do, don't repost all of my message! haha. Bye now. -mjl

2305. MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-20 01:15:35 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C5rCu1.1vG@sdf.lonestar.org>
Source record: 39016

I was wondering if the Minix file system was any faster or saved some space or anything. Basically, while case sensitivity and long file names would be nice I think it would just cause me some extra headaches. I also have a need to be MS-DOS compatible since I exhange floppies between my system and the ones at school all the time. Also, I don't have any programs (that I know of) that will take advantage of such a system.

I also wanted to note that ZOO definately isn't for me. Its slow and does not make a very good compression ratio. LH5 and ZIP-deflate are both faster and compress better with the only drawback being the 8+3 file names. I don't think that using the 8+3 file names makes me less of a "power user". Really, I don't keep that many files around that I need a new name for them all, and if I did they'd be sorted in directories anyway.

There is also some sort of idea going around that you can't be a power user and use GEM. Believe me, command lines are NOT any better at all. You just have to think a different way. Someone told me that pipes were impossible in a GUI. Pipes are VERY easy to do with a GUI!! You just have to rearrange your thinking, and as far as filtering text files in archives, well, I don't understand why the files justy can't be plain 80 column ascii like everything I download. I have NEVER needed to run my files through a text formatter and I definately would never need to search archives for keywords to format! My computer has better things to do.

CYA.

BTW, is there any good shell that is UNIX-like (but allows backslash to separate path names, no way I'm gonna change that habit. Either symbol is equally good so, "if it ain'tbroke, don't fix it!" I'll stick with '\') and allows execution through the TOSRUN pipe, and makes use of _shell_p ? That last is the most important one. A mint-aware shell that uses _shell_p/

2306. Keybd Buffer

Is there any way of locking the flow-control (RTS/CTS) on via this
Serial-Fix v2.0, without having to resort to using X-Control?

(I only have TOS 1.02, 1meg of RAM, and no Hard-Drive, I am not rich!)

X-Control on my system uses up too much RAM & disk-space, and generally
makes life difficult, so is there any way of locking it on via an
ACCessory rather than a CPX or any other method?

It doesn't have to be Serial-Fix, anything that will do the job is fine! 8-)

2309. conterm & Mint

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-20 08:10:03 UTC
From: partingt@fwi.uva.nl
Message-ID: <1993Apr20.081003.13989@fwi.uva.nl>
Source record: 39056

Hi everyone,

On old TOSses I used to set bit #3 in the conterm-byte so Bconin on
the console would not only give the ascii-code and the scancode of
the key pressed but also the shift-status at the moment the key was
pressed. This was useful to detect the user pressing Alt-A for
example.
In a multitasking environment (i.e. Mint) it is understandably not
wise to make global changes to the system so what can I do
that gives me the same functionality as setting bit #3 of conterm?
Is there soem Fcntl-call I could use or some other system-function
instead of Bconin?

Ta! Vincent

2310. PBM-PLUS problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-20 08:29:44 UTC
From: borst@cs.utwente.nl
Message-ID: <1993Apr20.102944@cs.utwente.nl>
Source record: 39058

Hi Atarians,

I am having some troubles using pnmscale and pnmflip from the PBM-PLUS
package (Graphics/Pbm/p?m-bin.zoo at atari.archive).

When I scale some ppm pictures, the size of the result is OK but the lower lines
in the picture are shifted to the right.
My assumption is that bogus-bytes get inserted in some lines.
Maybe raw bytes which happen to be a CR value are translated to CR&LF?
I haven't checked that out yet...
I typed
pnmscale -xysize 320 200 in.ppm > out.ppm
in mupfel, the cli in gemini.
I also tried the same using MiNT 0.96/init9akp but that didn't help.

The other problem is that pnmflip won't rotate a pgm picture generated by
ppmtopgm in.ppm > out.pgm.
It says that there is bad data where it expects a pgm-integer.
I checked the header and it read:
{'P','5',0xd,0xa,
'3','2','0',' ','2','0','0',0xd,0xa,
'2','5','5',0xd,0xa,.....}
It could be the same problem as above.

Does anybody know what's wrong?
Are there bugs in the port of PBM-PLUS to the ST or is it something else?

Also, can somebody name an anonymous ftp site where I can find the sources of
the package?
I would like to compile and run it on a Sun/Unix machine.

Thanks a lot.

Hi Ogal. Just a thought, but wouldn't the appl_tplay() stuff be a better
bet? Apart from being easier to code, it should also be legal. Note
that I've never used it, it just seems to be what it designed for.

I'm not positive about this, but I *think* the 525.LZH program that
was just posted to atari.archive.umich.edu (like within the last
couple days?) might let you convert .au to a more ST-based sound
format (like AVR or SND). You might also check for the program
Sox5 (at the same FTP site) - I believe that's a more command-line
oriented converter.

Hope this helps...

We went through the same discussion about democoders about 18months ago, with comments from both sides. Both styles of programming are different, and in their own way, can be exceptional. Demos are fun, they introduce a new dimension to programming that is not possible with workstations/U*ix et al. The relative merits and targets of programming demos/applications are entirley different, and should never be compared....

As they say here in the UK on The Big Breakfast..."Don't phone, it's just for fun!"

I believe that's what people like NIST (National Institute for Standards
Testing) is for. There certainly are people who certify C compilers as ANSI..
I think NIST is one.. CSL (Computer Standards Lab?) may be another..

| for.
|

I have to disagree with you here, Ian. I have a copy of Lattice 5.0 on floppies somewhere, and GCC 2.something on my hard disk. Lattice will probably get deleted when I need the floppies, but GCC will stay.

Yes, I know you hate CLIs, but I like them. I still have TOS 1.2 in my machine, so installing applications is a joke. However, with a nice Unix shell, all the useful stuff is a few keypresses away...

Thanks a lot for posting the Tape Loader (No irony marking smileys, I really mean it!). However, after having fooled around with a few ftp-able assemblers I must admit that I do not know enough (i.e. virtually nothing) about assembly code or assemblers to get it to work.
Would it be very problematic to post the binary as well? I have an 8 mHz ST, so that should work alright.

Thanks,
Hendrik Jan Bosman

> I have to disagree, I have Lattice v5.0...

If you want to judge the current release of LC (5.52) based on your
experiences with an old release (5.0), please feel free.

If you can get the GCC linker to look in multiple directories and find a
library file; if you can get the GCC librarian (AR) to properly handle
replacement of object modules that contain pathnames (rather than just
putting duplicate copies of each module in the library on a 'replace'
operation); if you can live with all the other "almost works right"
aspects of GNU C, then more power to you, I guess.

2326. MAKE beta testers wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-20 22:14:16 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Apr20.221416.664@mnemosyne.cs.du.edu>
Source record: 39073

I've ported a cool new MAKE utility to the ST, and I could use a few suckers...er...kind souls to test it out. In addition to the usual things most any MAKE does, it has these nifty features...

- Desktop-friendly (like my old STMAKE) allowing MAKE to be installed as the application to handle double-clicks on a .MAK file (but works just fine from a CLI too)

- Works with any compiler via a MAKE.INI file that contains default rules

- Supports multi-directory projects via a .PATH.ext= facility that lets you specify one or more paths for each type of input/output file

- Command lines up to 4k each, arg passing via ARGV standard

- Allows you to build "response files" on the fly during a make, and feed them to the programs MAKE is running; the response files can contain the expanded values of macros from the makefile

- Macro addition and subtraction of substrings via += and -= syntax

- Macro substring expressions allow replacing all occurances of one substring in a macro with another during expansion (eg, $(OBJS:.o=.c) will expand each FILENAME.O to FILENAME.C in the command)

- Filename parsing syntax in macros (eg, $(OBJ:^D) expands to drive and directory of the value in the $(OBJ) macro)

- Mini-CLI built in which supports common synonyms for basic CLI operations (eg, del delete erase rm unlink: all accepted to delete files)

- Supports special directives #include, #if, #ifn, #else, #endif, #abort

- Lots more

This MAKE is especially handy for managing large multi-directory projects such as programming libraries. (That's why I ported it, GemFast was getting too hard to manage with a basic-functionality-only MAKE).

You're a good candidate for being a tester if you're fairly familiar with MAKE already (and thus in a good position to try some of the advanced features) and you use the Sozobon, HSC, or GNU C compilers. (I haven't set up MAKE.INI files for other compilers yet.)

If you wanna join the exciting fast-paced world of beta testing, just send me email stating such. Also mention what compiler(s) you use, and whether you use a CLI or the GEM Desktop for a development environment. You have to be able to receive large (100k+) uuencoded email to be a tester.

It's my opinion that GNU C and GNU C++ are brilliant. It depends want you
want (more than anything, I wanted C++).

There seems to be a common suggestion (by only a few people, just repeated
a lot) that GNU software is somehow inferior because it is free. Quite the
reverse is in fact the case. GNU software is SUPERIOR because it is free,
runs under hundreds of machines/operating systems, and is effectively debugged
and enhanced by tens of thousands of developers all over the world.

Well, sure it's "simple as hell" to update the screenbase address, but
NO, it is NOT simple to properly write a hardware text scroller, unless
you simply use all of memory, which is completely stupid.

I have written and will shortly be uploading an extremely nice hardware
scrolling text viewer. It scrolls forward or backward at variable speed
and you can choose exactly how much memory it uses - this is actually
very tricky to get right. It is completely free of the restrictions that
annoy me about virtually all text viewers. There is NO limit on line length,
tab size, or end of line characters. It can load fonts and search for
strings, is compact and unbelievably fast. The user interface was the
primary design consideration - it's effortless and requires very little
to control it. No it doesn't use windows, and is hardware dependent, but
I like it a lot. I have a problem with seeing low-quality characters in
a small window on a 640x400 screen - this problem would go away if the
screen was considerably larger.

> However, things have changed and we don't want hardware-dependant
> programs anymore (unless they are presented in a DEMO, which is a whole
> different thing).

Depends on the program. Certain types of program can be produced in multiple
versions; most cannot, however, and should work on all machines. Small
special purpose programs are a different story. I'll produce two versions
that will work on all current machines and monitors that have hardware
scrolling - TT/Falcon will have to use ST resolutions. However, not many
people have either of those, and it's not yet clear to me whether Atari
will sell the Falcon. 8^(

Besides, there are choices - if you want small text in a window, you can
get M. Forget's program (Masterbrowse I think?), which is well done. I
prefer mine though. :) After using smooth flowing text for a while,
everything else looks jerky!

My opinion is fairly agreeable with yours.

>There seems to be a common suggestion (by only a few people, just repeated
>a lot) that GNU software is somehow inferior because it is free. Quite the
>reverse is in fact the case. GNU software is SUPERIOR because it is free,
>runs under hundreds of machines/operating systems, and is effectively debugged
>and enhanced by tens of thousands of developers all over the world.

What's notable is that there are some manufacturers (Hewlett Packard
being one of the more famous names) that have provided significant
commercial support for the GNU C compiler. Their customers wanted it,
and they felt it worth putting some development money into GCC. It
means that they get a good, standardized tool for a fraction of the
price it would take to develop their own compiler from scratch.

There are some caveats.

a) The Atari ST is really just barely powerful enough to host GCC.
GCC runs most happily on machines with considerably more RAM and CPU
power than the Atari ST.

Falcon would be powerful enough to host GCC quite happily. Assuming
it ever gets sold in enough quantity to be worthy of being called a
"real" product.

It's interesting that in the IBM PC world, GCC is only CAPABLE of
running on the higher-end CPUs like 386/486es. It never has and never
will run on an 8086/8088 based computer. The contrast between that
and GCC running on 8Mhz 68000 computers is worthy of note. That shows
the difference between the 68000 and the 8086 more graphically than
most other purported comparisons.

b) GCC supports a somewhat platform-independent object code format
that doesn't happen to be optimized to the Atari ST.

The GCC "native" object format happens to be different from the Alcyon format which most other Atari ST compilers tend to produce. The cost of this is that you need to use a GNU Project linker to link the code into final executable form. However, it DOES mean that you can use the various GNU Project utilities to manipulate the libraries, and don't have to redevelop them in Yet Another Custom version for the Atari.

c) GCC prefers to use 32 bit ints. GEM, and many commercial Atari-specific compilers have 16 bit ints.

This is a portability issue that isn't THAT hard to resolve. Other architectures have seen this problem before, and solutions such as int16 and int32 have been useful for resolving conflicts when they have been a real problem.

It's not as if GCC uses wrong-endian number representation, or anything seditious like that.

These are the "problems" that I see with using GCC on the Atari platform. If others have SPECIFIC criticisms, I'd like to hear them.

I would say that all of these problems have at their root the fact that GCC is inherently intended to be a portable C compiler that can be used on a variety of architectures, and is thus not perfectly optimal for the Atari platform.

That being said (that GCC is not "perfectly optimal"), the fact that so much development work has gone into it results in it being nonetheless a VERY GOOD product, which may be, despite the shortcomings, one of the best compilers available for the Atari ST.

I haven't enumerated the good things about GCC; that would take a lot more space.

I'll just ask: How many C compilers for the Atari ST support compilation of code that can use shared memory under MultiTOS? GCC supported it (although not necessarily at the Atari object level) before the feature was even thought of as a possible feature of MultiTOS.

GCC has enough hooks in it that it should be possible to add features like dynamic linking and dynamically loadable libraries without MAJOR levels of work. There's source code out there to do it RIGHT NOW. It'll take some work to make it work on the ST, and it won't be worth doing on less than a Falcon. I doubt that Hisoft will be adding DLL to their C compiler any time soon, unless it becomes so popular that they HAVE to (which implies that it's being used extensively under GCC).

2332. GSO - GNU SuperOptimizer

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-21 04:15:19 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1993Apr21.041519.23606@csi.uottawa.ca>
Source record: 39078

This was just uploaded to atari.archive as gso22st.zoo.

My question is, just what IS it good for?

The general point of it seems clear enough; you give it a function, and it it "exhaustively generates-and-tests" the shortest instruction sequence to compute that function.

That's clear.

What's not clear is just how one uses the output of the superoptimizer.

There's an -assembler option which produces code to feed to gas; it seems to rather prefer providing a "human-readable" version. What would one typically do next? Modify GCC's code generator to use the given sequence, and recompile the compiler?

What seems somewhat pointless is for gso to have a set of "default" functions to optimize. It's obviously timeconsuming to run gso on them; it would make sense to run gso ONCE on some fast Sparc 10 and generate a table of the optimal code for them, and have a TABLE for each processor for these default functions.

The table can't be THAT big, can it? Especially when it defaults to considering sequences of 5 instructions or less.

Or am I misunderstanding the usefulness of gso totally?

Actually, I would expect that Hisoft would probably have support for shared libraries quite soon after they become available for MultiTOS (*if* they become available for MultiTOS). They've always done a good job of supporting the ST. Indeed, Alex Kiernan has even made significant contributions to MiNT (and hence ultimately to MultiTOS).

I think both sides in this mini-"compiler war" are missing the point. Gcc has very poor documentation and support; Lattice on the other hand has a nice graphical interface, good documentation, and good support. Lattice doesn't come with source code to any of its parts; gcc on the other hand comes with complete source code, not only to the libraries but also for the compiler itself. This means that gcc is updated frequently, and new features are easily added to it. The two compilers are comparable in terms of code generation. I would say that they are suitable for different types of users... which is good, because it's unlikely that any one compiler could ever satisfy everyone's needs.

In case it isn't obvious: the opinions above are mine alone, and are most likely nothing at all like Atari's opinions...

Eric

:[...]
: Well, sure it's "simple as hell" to update the screenbase address, but
: NO, it is NOT simple to properly write a hardware text scroller, unless
: you simply use all of memory, which is completely stupid.

YES, it IS easy to write a hardware-dependant TOS-SHOW routine without using all available memory. What you do is allocate twice the normal screensize of memory and set up a double buffer in it. I won't go into the actual code to perform the scrolling, but it's easy! And when the scroll-routine is done you only put in some sort of VT52 control-code interpreter, which shouldn't be too hard either.

: I have written and will shortly be uploading an extremely nice hardware
: scrolling text viewer. [...]
: No it doesn't use windows, and is hardware dependent, but I like it a lot.

Will it work under MultiTOS? Of course not if you don't use windows. :-(

: Depends on the program. Certain types of program can be produced in multiple
: versions; most cannot, however, and should work on all machines. Small
: special purpose programs are a different story. I'll produce two versions
: that will work on all current machines and monitors that have hardware
: scrolling - TT/Falcon will have to use ST resolutions. However, not many
: people have either of those, and it's not yet clear to me whether Atari
: will sell the Falcon. 8^(

Ok for "Small special purpose programs" that are hardware dependent, but programs shouldn't be OS-version dependent! ;-)

: Besides, there are choices - if you want small text in a window, you can
: get M. Forget's program (Masterbrowse I think?), which is well done. I
: prefer mine though. :) After using smooth flowing text for a while,
: everything else looks jerky!

If MasterBrowser had worked under MultiTOS I would probably use it, unfortunately the dialogs doesn't work. As it is now I'm using the good (well, not good at all really) old VIEW-utility supplied with MTOS. I'm really looking for a good text-browser that works correctly under MTOS.

Christopher Browne (cbbrowne@csi.uottawa.ca) wrote:
:
: This was just uploaded to atari.archive as gso22st.zoo.
:
: My question is, just what IS it good for?

Nothing really! :-)

: The general point of it seems clear enough; you give it a function,
: and it it "exhaustively generates-and-tests" the shortest instruction
: sequence to compute that function.
:
: That's clear.
:
: What's not clear is just how one uses the output of the
: superoptimizer.

I haven't tried it very much myself (I just compiled it and put it
at atari.archive a month or two ago), but the general idea is that
it will output a syntax which on the specific processor easily (and
directly) can be translated into assembly language.

: There's an -assembler option which produces code to feed to gas; it
: seems to rather prefer providing a "human-readable" version. What
: would one typically do next? Modify GCC's code generator to use the
: given sequence, and recompile the compiler?

No, just do a direct translation of the "human-readable" syntax into
assembly language. Shouldn't be too hard since most sequences are
quite short. :-)

: What seems somewhat pointless is for gso to have a set of "default"
: functions to optimize. It's obviously timeconsuming to run gso on
: them; it would make sense to run gso ONCE on some fast Sparc 10
: and generate a table of the optimal code for them, and have a TABLE
: for each processor for these default functions.

I agree, why don't you mail the author and debate this with him. :-)
He might give you some clever answers (he's a Swede after all :-).

: The table can't be THAT big, can it? Especially when it defaults to
: considering sequences of 5 instructions or less.

Hmm, some of the functions will output a great number of different
versions which all gives you the same result. I found one that gave
me 112 different routines when optimized for 68k.

: Or am I misunderstanding the usefulness of gso totally?

There's not much to misunderstand. :-)

Nobody says you have to run Lattice using the IDE. I use Lattice with
a shell, emacs as an editor, make to control compilation, etc - no
GEM in there (not that I've anything against GEM, I just feel it has
its place). My main complaint about Lattice would be that it does not
support C++, and I gather is unlikely to, short of a large increase
in userbase (I'd loved to be proved wrong though, if anyone from
Hisoft is reading)

setscreen() viewers have been around since people discovered you could change
the screen pointer I guess. I even used one in the old days, the best one in
my opinion (view_it by Wizzcat). I don't see the problem about memory really,
using just two screens is fast enough for watching text. Just write two copies
of the next line, one at the bottom and one at the top and set the pointer
at the right place :)

anyway when I got my falcon and saw the speed of the built in textviewer I
just had to do something about it. What I did was to write something similar
to the setscreen() viewers BUT I vrt_cpy the standard format raster into
a window. This way it's nice and fast AND will work on any mode with/without
Mtos. The problem of course, and this is (imho) Atari's biggest problem is
the complete lack of speed in the VDI. It's ok in monochrome, but give it
some colors and the vrt_cpy slows down way to much to make any sense. They
tell you to program clean, follow the rules and all, but then why do they
make the VDI so slow people can't use it? beats me. One thing is sure,
it didn't help at all in making me stick to Ataris computers..

My program is still a lot faster than MasterBrowser and is about a third of the
size. I might even finish it off one day, you'll be the first to know :)

Cheers,
Torbjoern Ose aka (Hackbear/DF, yes another of those lame demo coders)

Your STe already formats MS-DOS readable disks! You can interchange disks between the two machines without any problems. Just remember to use double density (720K) diskettes if you're starting out on the PC. The only ST's that currently use 1.44 M floppies are the Mega STe, TT030, and Falcon030.

Try Everest. It is very fast, MTOS compatible. Everest is a text
editor, it uses about 100k. You can run multiple windows in it.

It's not even that hot in mono :-(Actually, the next biggest problem
is the VDI's inability to draw to a memory pixmap, so you can blit
stuff from it onto the screen.

You might try out Warp9, Turbo ST or NVDI to get more speed tho'.

I'll bet you 80% of programmers feel MUCH more comfortable using a CLI
for development. In fact, I can think of ONE person who uses the GEM
desktop for development... the other folks use a graphical shell like
Pure C/Turbo C's.

And, without programmers, any computer is a useless hunk of plastic and
silicon.

>For XBIOS, make the call and see if you get the function number back.
>Otherwise, the call has been sucessful.

Unfortunately, that's not quite true - on some TOS versions, XBIOS will
(for some functions) return a meaningless pointer into the ROM function
vector table instead of the function number...

For checking if there is a Bconmap() function, Atari suggests calling
"Bconmap(0)" and testing if the result is 0L.

For other functions, I'm not so sure which method to use - for some
functions, a variation of the above method might work; for others, it might
be useful to peek into the cookie jar (for example, if the _VDU cookie
indicates the presence of TT video hardware, EgetPalette(), EgetShift() and
so on should be present, too...).

These CRs (0x0d) shouldn't be there. UNIX tools generally assume that lines
are terminated by single LF (0x0a) characters.
If your tools have been linked with the GCC/MiNT libraries, try setting
the 'b' (binary) flag in the UNIXMODE environment variable.

Good luck,

Jens.

> Lattice C...only problem is that it doesn't support C++

This is a rumour. This is a rumour. This is a rumour.

Now that disclaimors are out of the way, I have heard it said that there may be a release of Comeau C++ for the Atari ST machines which will be able to use Lattice C as the back-end compiler. Comeau C++ is a cfront-style C++ compiler. I know Greg Comeau was looking into the possibility of supporting the ST platform. He even went so far as to create a /atari.st sub-topic in his vendor support conference on BIX.

It should be stressed, however, that Greg has never firmly committed to supporting the ST, announced a product release date, or anything else firm like that, to my knowledge. I don't want to be accused of saying that there was any sort of promise on the part of Comeau's company to support the ST. The only firm knowledge I have is that he expressed an interest in support the platform.

If I remember correctly, VDI draws to the 'screen' pointed to by
Logbase(). If you set wind_update(BEG_UPDATE), change the Logbase()
screen pointer to your memory area, draw with VDI, change Logbase() back
to the prior value, then call wind_update(END_UPDATE), you should have
achieved the effect you were after, and it should be MultiTOS compatible
(I think). I haven't tried this for a long long time, though, my memory
could be malfunctioning on me.

I have not tried this under MiNT, but that should not make a difference.
Immediately after getting the key using Bconin() you should call Kbshift()
which will give you the status of the shift/control/alternate/capslock keys.

The ST is fast enough (easily) that the difference will be transparent to
the user. Each of the programs I have released (ShadowTerm II and
MasterBrowse) use this method, and I've never missed a keypress.

2356. Problems with MiNT 1.04 and Minix filesystem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-21 19:50:24 UTC
From: jeffmay@magnus.acs.ohio-state.edu
Message-ID: <1993Apr21.195024.7255@magnus.acs.ohio-state.edu>
Source record: 39001
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anyone else had problems running MiNT 1.04 with the Minix XFS (version 0.55) installed? I have the filesystem running with MiNT 0.95, but when I try to use 1.04, the computer just hangs during the bootup sequence (right after the Minix XFS message). MiNT 1.04 works fine when I don't run the XFS, so I don't think it's the problem. I using a 4MB Mega STe with a Crazy Dots video card. I've tryed running from normal video with no other auto programs or accessories, but have had no luck. Any suggestions?

That's wrong. It only works for calls where the opcode is beyond
the largest supported opcode and it's not documented (try to call
Bconmap() on TOS 1.04).

>For VDI, there are no difference. A GDOS inquiry procedure exists, though.
>vq_gdos().

You can at least inspect the values in contrl[2] and contrl[4]. They
are only set to the correct values, if someone has indeed executed
the call.

The official Cookie Jar docs say that a program that installs a NEW cookie jar
HAS to install a reset handler, too. The latter is to clear the _p_cookies
location.

>there anyone around that has experience with this? Or could run one of the
>standard LaTeX files through these machines?

I just bought a 40 MHz 386 running linux, and I use TeX regularly. I tested TeX on a falcon030 and I would say that the 386 is faster by a factor of three to four. Of course, the TeX was not a 68030 specific version, so the falcon would do a little better in this situation. You wanted comparison to a 486, so you can add another factor of two or more (since TeX probably uses a fair amount of floating point operations, and the 486 has the FPU built in).

By the way, I was one of the whiners who always criticized the PCs and windows for being so slow. I was mostly a mac/atari/unix user before, but now that I have the 386, I do use windows occasionally. On my desk at work I have a Mac IIx (68030 @ 16MHz, like a falcon). Comparing MS Word and MS Excel on the Mac to the same progs and versions under windows, I can only say that the 386 blows the mac away. Granted the processor speed is more than double that of the mac, but the difference is _much_ more dramatic than a factor of two. I still don't like windows' interface, but the days of complaining that it is slow are over. Both mac and PC have 8 Meg of ram and are running with virtual memory turned off. I do have an inexpensive windows accelerator card ($120) that seems to help. Now I can't stand waiting for my ST or Mac IIx.

> ...the VDI's inability to draw to a memory pixmap

If I remember correctly, VDI draws to the 'screen' pointed to by Logbase(). If you set wind_update(BEG_UPDATE), change the Logbase() screen pointer to your memory area, draw with VDI, change Logbase() back to the prior value, then call wind_update(END_UPDATE), you should have achieved the effect you were after, and it should be MultiTOS compatible (I think). I haven't tried this for a long long time, though, my memory could be malfunctioning on me.
--

The trouble with this solution, is that with some video-cards, Logbase() is not used at all. The only solution, seems to be to use the SCREEN.SYS driver supplied by the new GDOS'es -Fontgdos, speedo and fsmgdos.
In the last news-letter I received from atari, they said they would document it in the next newsletter (I think).
Basically it is supposed to map all VDI-calls to a bitmap, in much the same way as you use a META-driver to write *.gem files.

2363. How to compile for shared-memory executable? pbmplus, actually.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-22 06:01:23 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13050@uqcspe.cs.uq.oz.au>
Source record: 39011

I'd like to compile the PBMPLUS package as a shared executable under MiNT,
but I don't know how to create such executables.

That is, one copy of the code will exist in memory, even if multiple
processes are executing it.

The reasoning is:

1. The pbm package can be compiled as either:
a. Lots of small executables, each with a copy of the library.
b. Lots of small executables, using dynamic shared libraries.
or c. One huge executable (with one copy of the libraries).

2. The pbm executables are almost always used in a pipeline,
with one pbm program feeding another.

On the ST (even with MiNT) we don't have shared libraries, so (1c) above
uses by far the least space on your hard drive. However, (2) means we
end up having multiple copies of this huge executable running at once.

Clearly, the solution is to compile the PBMPLUS package as a shared
executable.

I'll do it (I have a need for PBMPLUS), if someone will give me a clue.

>I'd like to compile the PBMPLUS package as a shared executable under MiNT,
>but I don't know how to create such executables.

You may not be able to with the current GCC support; it will only work if your data+bss segment are around 64K or smaller. (The actual limit would be 64K exactly, but you can finagle things around if you're "close enough" and have large arrays taking up a chunk of the space...)

If you've already built the single huge executable, do a size on it to see how it weighs in. The first thing you can do, if a lot of space is getting eaten in arrays, is to change the array declarations to pointers, and malloc the space at runtime. Other things you can do are to diddle with the order of variable declarations, so that if you had (e.g.) 63K of simple variables and then one huge array (its size is irrelevant, we simply assume that this single entity is what pushes you over the 64K limit), you put the huge array last in the executable. As long as it begins within the 64K line, everything will be addressable without problems.

Yes, this is kludgy and gross and ugly. Sorry. I know how to make things less gross and ugly and more flexible, and I know I've promised it since GCC 2.3.1, but I haven't had time to get it all implemented.

>tested TeX on a falcon030 and I would say that the 386 is faster by a
>factor of three to four.

A more realistic factor would be around 2 to 2.5 times faster. Of course,
having a multitasking OS like linux, or better 386bsd, contributes much more
to the apparent speed of an application, since you can always spend the wait
for one application running another one.

> Of course, the TeX was not a 68030 specific
>version, so the falcon would do a little better in this situation.

You didn't say what TeX you ran on the falcon. There are slow versions [like
the early Tools ports] and fast versions, like MultiTeX. Rhe 68030-specific
version of MultiTeX gives some 1-2% better performance on a TT -- this is just
using the -m68020 switch in gcc, no hand-crafted optimization.

>wanted comparison to a 486, so you can add another factor of two or more
>(since TeX probably uses a fair amount of floating point operations, and
>the 486 has the FPU built in).

TeX uses no floating-point whatsoever. Since the 486 is 1989 technology, as
compared to the 1986 technology of the 386, the 486 is inherently faster.

>By the way, I was one of the whiners who always criticized the PCs and

Thanks. Can you also comment on the price difference of these two systems.
I am contemplating on which system to buy next and a 386/486 Linux system
is one of the options. The Falcon DSP is also an important issue, but maybe
the PC machines will have a similar board by the time. (A normal soundcard
is a bit meager, I would like to experiment with sound synthesis and sound
processing).

Hmmm, well I believe that at least some Comeau has posted a message
stating that it was almost ready last year. By the way since then I
never read anything from comeau in the newsgroups here. Do they still
exist as a company? And I remember that they made Gramslam and other
grammar-oriented software for the ST. I was planning to buy Gramslam,
but I never knew any adress or pricing on it so if anyone knows a bit
more I would love to hear it.

Everest really is good. But it has free positioning which can sometimes be a bit difficult, depending on what you use the editor for. Another good editor is 7up, an editor that can open up to 7 windows for textediting. Overall 7up is a slight bit easier to work with, but not as stable (it very occasionaly may crash) as everest. 7up shoudl also work with MultiTOS.

Ok, after a lot of hassle trying to find something, I've found a stop-gap measure
in the form of the MikeNet program. Works with or without MultiTOS, and supports
ST/STE/TT/Falcon. Lets me drive share between them. Thats all. So I can stick
a chunky SCSI HD on my Falcon & my ST (2.5Meg) can use it too. This'll have
to do until someone (me?) writes a Networked MiNT filesystem.

Found the program on atari.archive, and it seems very stable.........

: (relative to a port of the PC version:)
I wouldn't count on a Linux port to a (Mega) ST(e). Linux makes
extensive use of the 386's MMU. So you need at least a 68030 machine
to make it tick. This also why the Amiga port is only for the more
advanved machines. There are however Falcon/TT user working with the
Amiga team. They can give you all better info.

Just my 2 cents,

>My question is, when a GFA program loads, does it use all the memory in
>the area it loads into and free the other memory?

You can insert command into Your source, that tells the GFA-Basic compiler not firstly to use the complete memory. It's the $m-Command. So if You insert '$m24000' in the beginning of Your source, the compiled programm reserves only 24000 bytes.

But remember: if You reserve memory Yourself with the RESERVE-command, You have to be sure, that You give only the rest of the memory free, except of those 24000 bytes.

Another problem could be, that this memory must be a multiple of 256 bytes.

I hope, I could give a little help to You...

Ciao, Andy

Just use TOS formatted floppies, and MiniX on your hard disk. Of course, when you copy a long filename to a floppy you'd have to rename it, or accept the default renaming that your copy program gives you

>Really,
> I don't keep that many files around that I need a new name for them all, and if
> I did they'd be sorted in directories anyway.
>
Its nothing to do with the number of files you have. For one thing its the convenience of giving files useful names - once you've had it, its hard to do without it. Or as a more concrete example, supporting libraries with different compilation modes. For example, under Lattice C, a library can be compiled with 16/32 bit integers, register/stack based parameter passing, base or non base relative code. They' re just the standard ST modes, once you start trying to keep libraries built for 68030s, etc as well, it gets even worse. Now your filename has to reflect these options, and it needs a standard extension (.lib), so allowing a single letter to indicate an option (the defaults are `s', `r', and `nb', ie 4 letters not 3) you're left with 5 letters to adequately name and describe your library. Surely something like popup.menu.srnb.030.lib is better than popmsrnb.lib (which doesn't even indicate its for a 68030)

> Pipes are VERY easy to do with a GUI!! You just have to rearrange your
> thinking,
Not trying to flame, but can you explain how you figure that one? For example, (not particularly ST specific) how would you go about doing the command `ps -aux | grep mebeb | grep -v grep' under a GUI? BTW, that command lists all processes belonging to me on the system I'm now on, with the exception of the one I'm using to look with (spot the deliberate oversimplification 8-)

> and as far as filtering text files in archives, well, I don't
> understand why the files justy can't be plain 80 column ascii like everything

>
I was wondering about something similar recently. I've recently been
converting one of my programs from BIOS I/O to VDI/AES I/O, and one of the
things I've been wondering about is what happens if the user types whilst
the screen is getting updated? Say he types a key with control held down,
followed by some key without. If I then read these keys (once the redraw is
finished), and check the shift status after each key, will the shift statuses
I receive reflect the statuses when the key was pressed, or the statuses
when I do the check? Does, in fact, the word `statuses' even exist? 8-)
I could check easily enough for myself, but I haven't got round to that
part of the coding yet. If it doesn't work properly, how do I code for this?

Thanks in advance,
Kev

> Erlend.

No, no, use Emacs. Okay its pretty slow on the ST, doesn't directly support
MultiTos (though it could), and no doubt uses up a large percentage of
your available memory, but it blows everything else away. As for editing
several files, you can edit as many as will fit in memory, and have as many
windows as will fit on screen. All hail Emacs, etc, etc.

BTW, what happened to the port of Emacs 18.59 that someone mentioned was
almost ready a few months ago? I've heard nothing of it since.

Try the okami-Shell. It supports MiNT and has a lot of build-in
commands which make the ST a little faster than but used more memory.

The current version is 1.5 and it is supposed to be on many german
ftp-servers. (but NOT on tu-bs.de!)

Okami supports the / and the \ Notation, well it converts every
/ to \.

> Comeau made Gramslam

Different Comeau. Greg Comeau (whose company name I can't quite
remember, Comeau Software or Comeau Computing or something like that) is
certainly still in the compiler business, and continues to upgrade and
support the C++ compiler on several platforms. He had nothing to do with
GramSlam. I saw a demo version of gramslam once. It took me about 15
minutes to disable the demo-timeout features so that I could actually try
it on a reasonable-sized document. It was absolutely the lamest attempt at
grammar checking I've ever seen. It was just plain wrong on 90% of the
things it flagged, and on the other 10% it was being overly picky or not
considering things in context. Later versions may have been better, I dunno.

> I can think of ONE person who uses the desktop as a development
> environment.

Gee, I wonder who that might be referring to? ::grin:: Chris, I'm not the only one, just perhaps the most vocal.

Mail response I've gotten for my beta testers request indicates that there are a fair number of folks out there using GEMENV and STMAKE to enable program development from the desktop. Your 80% number is probably about right, actually.

To me, it's perfectly natural to instal TEMPUS as the application to handle double-clicks on .C, .H, .S, and other common programming-related file types, and STMAKE as the application to handle .MAK files. Then it doesn't take more than a click or two on the desktop to navigate your way around your development tasks. (Substitute your favorite editor for TEMPUS, of course. I don't love TEMPUS, but it's okay.)

2385. Re: Problems with a Atari TT and a SPECTRE GCR MAC emulator

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-22 17:45:49 UTC
From: bjgrier@bnr.ca
Message-ID: <C5wC0E.4qH@news.rich.bnr.ca>
Source record: 39040

I had a few problems also but they were mainly operator error, on my part.

First get a MAC system floppy, Spectre format. Access a 720k disk in your internal drive (open a window, press escape, ...). Now run Spectre 3.0 at least. Place the MAC system floppy in the drive and press the return key. If nothing happens press the "F1" key and see if it comes up.

If this works then go on to the HD. Remember the current version of Spectre can not use the TT's internal HD, you must use the DMA port.

2386. SUMMARY: FAX software for the ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-22 18:01:57 UTC
From: Michel Goudeseune <michelg@zooid.guild.org>
Message-ID: <1993Apr22.180157.13762@zooid.guild.org>
Source record: 39038
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here's the information I received about FAX software for the ST.

[I have freely cut and pasted the various replies.]

There are several programs available:

Straight Fax!

Developed in the US by Joppa, requires 1 Meg RAM, works in colour or mono. I seem to remember the article saying they couldn't get it to work with some of the modems they tried. (I'm just guessing, but this software might be known as Joppa Fax in the US - I seem to remember seeing an ad for a product with a name like that in an old issue of Current Notes.)

You've probably already read this a gazillion times, but you can't do better than StraightFAX on the ST... It's available from Toad Computers.

Straight Fax is by Toad Computer
570-F Gov
Ritchie Hwl.Sevena Park
MD 21146 USA

Straight Fax cost 99$ [currency? us$, I think -MG]

Tele Office

Developed in Germany by TKR, requires 1 Meg RAM, works in mono. The article said they couldn't get it to work in colour, but admitted this might be because it was a beta version.

According to the review, Tele Office was much more powerful and flexible, but not quite as easy to use. Both were quoted at the same price, about 60 pounds sterling. I'm not aware of any PD or shareware FAX software being available yet...

Based on this, I recently bought Tele Office to use with my SupraFAX v32bis modem. I haven't used the software much yet, but I did get as far as testing it by successfully sending a FAX to someone. I needed help to set it up though, because the supplier sent it without a manual. They warned me about this before I bought it, so I knew what I was getting into ! :-) It was still being translated into English from German at the time; this has now been completed and I received a copy of the manual recently. And the support I got from the supplier over the phone was good enough to help me get going.

As I say, I haven't used it much, so I don't know whether all the features work well or not yet - and I haven't tried it with a colour monitor, so this is all I can tell you.

HackFAX

If you bought a ZyXEL you can use HackFAX. Search for the archive HFAX060.LZH.

Michel, I noticed on a recent pass through the Newitems driectory at atari.archive.umich.edu a program called 'hfaxbeta'...take a look, it may be a fax package!

[Note: I haven't checked out either of these yet. I have a SupraFAX modem, so I'll see if this will actually work with mine.]

There was also a referral to the December 1992 issue of Atari ST User, the UK version at least. It gave a review of StraightFAX and TeleOffice. A summary of the review is included above.

Q-FAX/Pro

[Does anybody know anything about this one? :-)]

That is all! Thanks again to the contributors. For a list of the contributors, ask me in email.

Source record: 38894

Having had a chance to play with/use Speedo GDOS, I'm quite impressed with its speed and robustness.

However, it seems to suffer from the typical GDOS malaise - bugger all in the way of printer drivers.

I notice that the 'old' style printer drivers don't work - that's quite understandable really, but you get BJ10, FX-80, HP deskjet & laserjet, SLM and NX-1000 drivers. Nothing useful like a 24-pin epson driver, or a proprinter driver (although the jury is out on whether or not the BJ driver will work like that).

Anyway, this is what I'm asking - Are there more drivers?

If yes, where do I get them?

Replies as you wish...

GNULIB is a list of directories to search. Works fine for me (most libs
are in my /gcc/lib, but ams.olb is in /usr/ams/lib, and gem++.olb is in
/usr/gem++/lib).

Dear everyone,

Ian really has something against GNU and CLIs for some reason.
Me, I think they all have a place. If someone likes using a
GUI, that's fine - in fact, I prefer to use the desktop to move
files around (better feedback). If someone wants to use GNU
tools, that's fine. Commercial tools - fine too.

Ian will say anything to dirty GNU tools' excellent image.
True or otherwise.

HUNDREDS OF THOUSANDS of people use GNU tools.

Anyway. This isn't gnu.misc.discuss. GCC works, and works VERY well...
And you get C++ as well (and ObjectiveC too, if you want).

Ther's an acessory wich allows this, but in a slightly different way:

chameleon, from Julian Reschke (I think he programmed it). You put one or more
copies of this one in the boot partition, the other accessories in a folder.
There's a place in chameleon you can edit (with any track-to-track editor) to
specify an acessory which have to be loaded when booting. That's it.
What's better is that you can later unload the accessory and replace it by
another one.

Hope this helps....

Here you are partly wrong: when using the option h with zoo, it packs exactly
as good as the lh5 method, because it uses the same algorithm, so the
compression ratio is not a problem, except when one does not read the manual :-)
Concerning compression speed, you are totally right, but thats because of zoo
being writting totally in C, and lharc and zip being written in assembler,
at least the compression routines.

2394. Uuencoded files decoder wanted!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-23 08:34:49 UTC
From: jared@midiline.la.ca.us
Message-ID: <q1ag3B3w165w@midiline.la.ca.us>
Source record: 38942

I need the program that allows me to translate uuencoded files into their original binary format. I would be more than happy to offer my address to anyone who has the program and can mail it to me on a disk with instructions for use.

Make all replies to this message in Email to: jared@midiline.la.ca.us

Thank you...

Jared

>Thanks in advance.

Apart from convenient single stepping at the program source level, and accessing local variables by name, it doesn't offer a great deal more than the MonSTC debugger that came with Lattice. And the screen updates are much slower. And it has trouble locating sources which are in more than one directory - but I think I may be able to get this bit working, I just haven't had time to play, recently.

What amazed me was that a source level debugger can claim to be such when it does not understand typedefs and structures etc (You can only display 'simple' variables).

It's nice to be able to configure so many options, though. I did think that the key combinations in monstc were far from intuitive. The default setup for XDEBUG is based on CodeView.

4 out of 10, I reckon.

Grrrrr..... Emacs.... I already have Teradesk as a shell. No need to
use Emacs as a compiler/TeX/newsread etc. shell.
For non-intuitive work I prefer STevie, which is one of the 4 editors
on my harddrive :)

2399. Where are the tos chips?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-23 11:13:34 UTC
From: naffara@crc.ac.uk
Message-ID: <1993Apr23.111334.8676@crc.ac.uk>
Source record: 38948

Can anyone tell me where the tos roms are in a STFM and a old (tos 1.2) Mega ST and also what they look like?

Is it just a case of swapping the chips over (the STFM has 1.4) or is there any thing else you have to do?

Will this cause any problems with my SH205 harddisk which was (probably) formatted with tos 1.2?
I would like to have tos 1.4 in the mega because it is supposed to be faster and better with a harddisk.

one last thing, are the chips easily damaged? (hopefully not!)
Thanks for any help
Phil

Hello everybody!

I want to install a version of LaTeX for my Atari TT.
I have a bubble jet printed BJ 10ex
and I want to know what files are needed for having a small but running
version of LaTeX.

I look in the directory Tex in the ftp server
and they seems to have very high number of files!

I want LaTeX,
a gem DVI viewer
and a program to print file on my BJ10ex

Could someone is able to tell me what files I need?

Thanks by advance.

Jerome.

>windows as will fit on screen. All hail Emacs, etc, etc.

I shall join in the "favourite editor" bandwagon with my persomal
preference - MicroEmacs. I'm sure there are billions of things that it
doesn't do that the full Emacs does, but there are lots of plus
points:

1. It can be mouse/gem driven (although the interface isn't perfect,
as it's basically just been tacked on).

2. It has a fairly good macro language, which I find much more
comprehensible than ELISP (this may just be my failing :-)

3. It doesn't take up too much space, so is viable for people who
don't have a hard drive.

4. As with full emacs, you can edit as many windows as will fit on
screen, and with the GEM version you can have more than that.

Anyway, just my 2p. (that's around 3 cents for you Americans...)

>which will give you the status of the shift/control/alternate/capslock keys.

Hmm, I don't really like that method....it all depends on the user not letting
go of the specific key too fast and this way the keybaord-buffer is no use.
Adn what's more, with TOSWIN the screen can react quite slowly sometimes and
then it really gets to be a problem. I'd only want to resort to something
like that if there are no other alternatives.

>The ST is fast enough (easily) that the difference will be transparent to
>the user. Each of the programs I have released (ShadowTerm II and
>MasterBrowse) use this method, and I've never missed a keypress.

is this for regualr typing or for option-shortcuts? The latter don't tend
to come in such large numbers, which is lucky because they are the ones
that mostly need Ctrl or Alt to be pressed...

Ta! Vince

|>
|> end of story.
|> Dom

That's not quite true actually Dom. The Sun SPARC station 10 at work (my access to the Usenet/Internet) has a floopy drive, takes the right disks and even has some software on it (MSTOOLS circa 1989) that will copy files onto the DOS formatted disk, low or high density - it's auto sensing. But, when you put these disks in the atari text files consist of the first ~80 lines only, repeated enough time to make up the correct file length. This happens even when using the text copy mode of the software. Binary file are unusable.

If anyone has any suggestions at how I can avoid having to use a Mac as a middle man to get files from the Sun to my STe I'm all ears.

Martin

P.S. I've cross posted this to the c.s.a.s.tech group in case anyone there has any ideas about Sun UNIX to STe transfer of files.

I had some problems with c++ programs running under MS-DOS (gcc 2.3.3). It seems that gcc still has bug concerning templates and overloaded operators for derived classes. Gcc might be good as a C Compiler, but has too much problems with C++ in the current version.

Get the latest version of Mtools. Version v2.0.5 was posted to the
comp.sources.unix news group the 2nd week of January 92 as v25i097
thru v25i099. Subsequent patches have brought the version up to
v2.0.7. I have no trouble reading and writing Atari disks on my old
Sparc 1.

The symptoms you describe suggest a messed up FAT. This could be as
simple as a media change problem. For example, if you format a disk
on your STe, move it to the Sparc, write a file on it, and then move
it back to your Ste, the old FAT is still cached in the Atari. You
need to force a media change to cause the FAT to be reread from disk.
This can be done by opening a window on the disk and then pressing ESC
(for TOS 1.4 and later). Similar problems could conceivably occur if
the disk is not formatted properly. Try letting Mtools do the
formatting (using mformat) and then see if it is readable on the
Atari. The Atari is fairly generous about what it can read.

A couple of caveats: (1) Mtools as distributed only handles standard
9-sector disks. It is possible to get the Sparc 1 to read and write
10-sector disks, but the method is not supported by Sun and has some
problems. Things might be different on the Sparc 10. (2) Mtools
assumes MSDOS conventions for text files; namely, it converts Unix
newlines to MSDOS <CR><LF> and put a ^Z at the end of the file. An
easy code modification eliminates the ^Z for Atari use.

If you've been reading the 680X0 channel on Linux you'll have
noticed that there is suddenly a large amount of traffic
discussing the sources and availablity, with respect to other
platform writters getting going. There have currently been
quite a number of offers from TT users for their services to
get going on the TT project. Things finally appear to be
picking up on the linux port for Atari's. However their is
still some way to go even on the Amiga version, so it's not
going to be here next week; but with any luck it will be
available on TT's...

If anybody is interested in joining the 68K channel, even
just to be kept uptodate on the project send a message to,

linux-activists-request@niksula.hut.fi

If you want the help file then leave the subject and message
blank, and no signature, it can cause problems.

To join the channel send a mesage with no subject and the
FIRST line of the message set to,

X-Mn-Admin: join 680X0

>operation); if you can live with all the other "almost works right"
>aspects of GNU C, then more power to you, I guess.

So your complaints are really not about gcc compiler but about
some acompanying tools. These are not really parts of the compiler
itself; they were provided by various folks at different time to
make all this stuff to stick together on your Atari and there is
nothing sacred about them. Sources are freely available and complete
replacemets, but better backwards compatible, are surely welcome.
In particular smart or a smarter linker would be really nice.

All this project holds together because many peple many times decided
that for their tastes something "almost works right", or does not work
like it should at all, and provided evolutionary replacements.
If you have better ideas, or something bugs you hard enough, you are
certainly welcome with your contribution.

Somehow I have impression that Ian has problems since he still does not
believe that 'make' is a good tool. :-) De gustibus ...

That's not necessarily a good answer. If the Ani Pro file format
addresses pixel colours via registers, (and I expect it does) then
it takes an extra step in the translation to map the colours. That's
going to slow things down.

>Now, to say that one system is better than another (or to say that one
>is more "brain-dead" than another) is pure naivety. Each style has
>greater and lesser consequences.

I'm sorry, but I can't agree with that. My position is that
for cases 1 and 3 you are correct in saying there are significant
advantages and disadvantages which make either a legitimate choice,
but having worked all 3 types of displays to some extent, the Atari
form with is case 2 *is* "brain dead". It generally has the
disadvantages of both without the advantages.

>One of the greatest advantages of (3) is that you don't have to use all
>the bitplanes. (2) also has this advantage, but has the added advantage
>that when you do use all bitplanes, access is still very fast (because it
>is still local).

This isn't generally true. There are two scenarios for graphic
memory accesses, 1) by the processor(s), and 2) by display. In Ataris
and Amigas the "processors" includes blitters and any custom chips
as well as the CPU. Since the custom processing chips can be designed
to address via offsets of internal registers, they can be designed
to address bit plane size block offsets pretty much as efficiently as by
incrementing the register. As for the CPU, in theory things are
a bit trickier to analyse. There aren't many cases where it's useful
to read 2 words into a register at the same time, which is the most
efficient "Read" mode for a 68K processor, because then you end up
with, say the LSb in the high word and the NextLSb in the low word.
What are you going to do at that point? You can copy the register
to another register and then shift it. That's 2 instructions.
I don't have a cycle count handy, but if it's in cache, that's probably
just a tad quicker than 2 separate 1 word reads, but you'll lose the
advantage if you fall out of the cache (I'm assuming an 020 or above--
probably no advantage at all for 68000 or '010). On the other hand,
for a full bitplane system, if you have enough address registers free
you can set up 1 register address each, pointed at the bases for each
bitplane and address that way fairly quick. It's unlikely you'll

find any advantage to "word bitplane" addressing over regular "single bit" bitplanes. Let's leave the generalizations behind and try the "real world" test. If you can show me an example of useful code that demonstrates an advantage of the Falcon's 16 bit interleave over the Amiga 1200's full bit plane, post it and we'll look at it from that standpoint. Keeping in mind that few people have both a Falcon and an Amiga 1200 handy, we'll allow for a bit fudging on it being "real world". At least both computers exist so the ideas can be checked. But stick to *useful* code examples.

...

>The Falcon gives you the very best of both worlds - word-interleaved
>modes right up to 8 interleaved bitplanes, and a 16-bit (word-per-pixel)
>bit interleaved mode.

In my terms that would be the "crippled word-interleave modes right up to 8 interleaved bitplanes and a crippled 16-bit (word-per-pixel) mode (because it doesn't have colour registers)."

>IMO, you can't ASK for much more than that (except extremes like 24-bit,
>32-bit), but Ian would complain about those too ("Waaaaa, you have to modify
>4 bytes just to change one pixel!")

That's 1 "LONG". That's not going to bother Ian. He knows that that's a single read or write for an '030. *You* might have a problem with that if you don't understand that this is the natural addressing size of the '030 rather than 16 bits, but Ian? No, I don't think Ian would have a problem with that. :-)

2412. Multi-Screens

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-23 17:03:31 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C5y4pw.6D8@sdf.lonestar.org>
Source record: 38983
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

OK, folks, here is the problem.

To use VDI commands you need to open a VDI workstation and all the commansd work on the screen. Now, I want to draw, using VDI, onto a buffer!

I thought about just opening a VDI workstation, and then moving logbase to that buffer, then I could do the VDi command, and move logbase back where it was. This doesn't seem to be the correct approach. Is there a better one?

Also, what if the other scrren (in the buffer) in in a different resolution. Is there any way to trick the VDI into doing it correctly? This has to work under MiNT/MultiTOS so I don't want to do anything global to screw up the system and I don't want to use ANY LineA. However, different resolutions are just kinda a nicety right now. It doesn't HAVE to be different resolutions.

What if I were in ST Med, and I did my drawing on a buffer screen moving logbase (assuming this will work at all), could I then bit-blit this onto a low-res buffer ? It seems the only way to draw between resolutions is through bit-blit since that is the only time you can specify different screen resolutions and number of bit-planes (which is likely why the Falcon uses bit-planes for 256 color mode. Compatibility with vro_cpyfm()). But would I be able to get the extra colors this way?? Any help would be appreciated.

Basically these screens are gonna be used as window buffers and the redraw will just be a vro_cpyfm(). And when the user hits the FULLER I'll either increase the window to full size and remove all the gadgets or move physbase to my buffer with Setscreen() - possibly changing resolution too. This option will be user selectable.

I can't store the data any other way since there could be who knows how much VDI graphics that need to go into the window, and I refuse to redraw everything just cause the user hit the arrow on the scroll bar (do you know how slow 20-30 VDI commands per line would be???). Again there is no way to know at programming time, exactly what VDI commands will be used. This is for a terminal program that uses both text and graphics and sound, etc. etc.

2413. Re: gdb for MiNT

> Thank for your help,
>
> Rainer
>
> email: menes@statistik.tu-muenchen.de

For all you unwary, who don't know of debuggers for the humble GCC: :-))

I know of no port of GDB 4.5 to the ST/MiNT. I've tried once, but gave up on behalf of the BFD (Binary File Descriptor library). After several mails to Cygnus support (the original authors of the BFD) without reply, I canceled the project.

Instead I ported GDB 3.5, which should be available in binary and sources on a.a.
But I must say, the port of Andreas Schwab is much more sophisticated.
You'll find this as binary on ft.germany.eu.net. Sources were distributed via comp.sources.atari.st.

For all you C++ hackers, there's a port of GDB 3.6,
(also from A. Schwab), which handles GCC 2.X output and C++ more
coveniently. Sources are available on ftp.germany.eu.net, too.

Hope this helps, Joe

Well if you're talking about "setscreen viewers", which mine is not, then maybe you can use two screens and write two copies of each line. This is completely impossible for a hardware smooth scrolling viewer, though. My program scrolls hundreds of times faster than that. At the max rate (which is really arbitrary, but fixed - there is no point in going much faster than "unreadable" :}), it is impossible to have enough time to write two lines or even one line while scrolling. Wait till you see it - I actually tried coding it the way you mention, it don't work, trust me. :} Especially if you correctly handle tabs and long lines.

Well if you're talking vdi and vrt_cpy you're not talking about anything like high-speed, which is what I wanted, and achieved.

Well, from your answer, we're not really talking about the same thing. You're
wrong, I know what your two-screen method is that you refer to, and it's
WAY too slow to do high-speed hardware smooth scrolling on a 8 Mhz STe.
You're talking about old stuff that uses setscreen and writes two lines
at a time, that is impossible to do while you're smooth scrolling at high
speed without slowing the scrolling down. VT52 control codes? Ha ha ha.
You're definitely not talking about speed. When you see the program, you'll
know what I'm talking about.

> Will it work under MultiTOS? Of course not if you don't use windows. :-(

If you want text in a window, then no it doesn't do that. On the other
hand it is several hundred times faster than that. It should run,
but I doubt it would multitask. Can't say I care particularly.

> Ok for "Small special purpose programs" that are hardware dependent, but
> programs shouldn't be OS-version dependent! ;-)

All it requires is hardware scrolling in the machine, it is not os-version
dependent. Whether it is multitasking friendly is a separate issue. A lot
of software isn't.

Source record: 38961
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

According to the Falcon documentation, the Blitter is a coproceesor
which to me means it runs in parallel with the CPU. Even if it did not
have interleaved memory access (as of DMA on STE) it could still aquire a
large amount of bus cycles due to the CPU's cache(this will depend on the
Cache hit ratio).
So the question is 'Why are people saying that the Blitter is
useless', as it should be able to work in parallel with the CPU.
Please state the source of your 'facts', or system timings, and not
speculative remarks.

I'd agree there. Atari should just license NVDI and put it into the TOS
ROMs. (Actually, since I'm using a RAMloaded TOS 4.04 right now anyway,
I don't care if it's ROM or RAM... But it definitely ought to be standard.)

Not to mention the Blitter has 32-bit wide access to RAM and the CPU only has 16-bit access. In some situations this might help. But in some situations you would only want to do 16-bit access to RAM with the CPU EVEN IF IT HAD 32-Bit ACCESS. Any situation where you 'calculate' the color of a pixel, you would want to go ahead and store that pixel instead of trying to calculate 2 pixels at once. I don't think that the 16-bit bus to the CPU was as bad as everyone has made it out to be. Even in the game I am working on now I would still use 16-bit accesses to RAM because it would be faster than trying to put together a 32-bit screen chunk.

: wrong, I know what your two-screen method is that you refer to, and it's
: WAY too slow to do high-speed hardware smooth scrolling on a 8 Mhz STe.

Now listen, I know EXACTLY what I'm talking about. And if we are talking about a TOS-SHOW-thingy (only scrolls in one direction, downwards) then you're TOTALLY wrong when you say an 8 MHz STE can't do fast smooth-scrolling using the method I described. Even if the scrolling is multi-directional you're wrong.

I don't say you can't do an even faster scroller, but I strongly doubt it. Somehow I think we both talk about the same thing. To scroll anything on the screen without using lots of memory does automatically force you to update AT LEAST as much as you scroll. If you rely on using Timer B or HBL interrupts it's possible to make a scroller that is even faster than the one I've described (I think so at lest, haven't tried it myself). It would involve setting the screenpointer every 8th scanline (or 16th or 4th depending on how fast you want your text to scroll). It's much more complex and the overhead presented by the interrupts as well as the possibility of getting flicker due to non-accurate interrupts (remeber that a mul takes 70+ cycles and an interrupt has to wait till the instruction is finished) would probably not make it a very nice option...

: You're talking about old stuff that uses setscreen and writes two lines
: at a time, that is impossible to do while you're smooth scrolling at high
: speed without slowing the scrolling down.

NO NO NO! I can't imagine where you've heard that an 8 MHz STE can't update 2560 bytes/VBI (16 pix high font in monochrome). It can probably update so much of the screen that you can scroll 1/10th of a screen 70 times a second. That would mean 7 pages of text in one second. Is that fast enough?

: VT52 control codes? Ha ha ha.
: You're definitely not talking about speed. When you see the program, you'll
: know what I'm talking about.

Why would VT52 escape sequences make it much slower. You just don't use any of the code from the OS but write your own VT52-handling. The overhead per normal printable character would be very low. Just use a CMP-BLE combo to check if it's control code or not (20 cycles if memory serves me). And the test only needs to be done once for every character (even though it must be printed twice because of the double-buffer). Updating 1/10th of the screen is about 200 characters with 20 cycles overhead per char. That

makes 4000 cycles (~3.5 percent) of overhead for checking for control-characters every VBI. Every VT52-function would of course add quite a lot of overhead since the X-position would have to be calculated by multiplying, which is rather slow on a 68k.

: If you want text in a window, then no it doesn't do that. On the other
: hand it is several hundred times faster than that. It should run,
: but I doubt it would multitask. Can't say I care particularly.

Maybe YOU don't care, but what about all who use MTOS? What do you think they will think of your program when it screws up their desktop. I doubt they'll use it much! :(

: All it requires is hardware scrolling in the machine, it is not os-version
: dependent. Whether it is multitasking friendly is a separate issue. A lot
: of software isn't.

I wouldn't say that! Maybe if you look at OLD software you'll find high percentages of non-friendly software. But we're living NOW, not yesterday (or 3 years ago). :-)

Why don't you explain how your program works! It would make this discussion much more interesting. :) It's very possible that I've overlooked something that would make double-buffer technique impossible to use, but I can't tell unless you tell me what your program is capable of.

Happy scrolling...

Source record: 38976

Hello,

I am using a 16MB minix partition under Mint(0.95). It works very well and
makes you feel like sitting in a shell and going *nix, but now i
have a problem :

I want to back up this filesystem, but i do not have any tools
that will archive & restore the full file permissions, owner and extended
filenames. What i am looking for is some kind of 'tar' or 'zoo' that
works with extended filenames and that do not use the "tos-compatible"
filenames (i want "Foo.bar.c.Z", not "foo,bar.c,z")

Btw, what UNIXMODE settings are availeable for gnu-compiled tools,
and which of them are useful with MiNT ? (a complete list would be nice)

Thanx for any information,

Frank

> Ian really has something against GNU and CLIs...

Oh great, don't attack the message itself (perhaps it's unassailable?), instead tell everyone to ignore the messenger.

I didn't know about the GNULIB list of libraries to search. (I presume you mean an env var named GNULIB?) I was foolishly using a LIB= env var with a list of paths. My mistake, either I never saw it in the docs (a clear possibility, the docs being mostly non-existant as near as I can tell), or I just overlooked the info if it was there in the quick-reference card. (Easy enough to overlook, since that quick reference card is all full of texinfo control sequences.)

I notice you didn't address my other recent comment about GNU tools that appeared in the same message: the librarian tool doesn't work well if the modules contain pathnames. EG, GCC-AR rs MYLIB ..\MYOBJECTS.OBJ\module2.o this will generally not replace an existing module that was added to the library using the same command earlier. Instead of stripping the path info and using the module name, it seems to hash up some sort of bogus name to shorten it. Then when you try to replace the module later, even though you'd think it should hash to the same value and do a replace, it doesn't, it just adds the module as new.

I don't have anything against CLIs at all, except a personal dislike of them as a working evironment. I don't remember *EVER* saying that anyone else should shun CLIs if that's the way they like to work. I just don't use them myself, don't intend to start, and will continue to provide tools that allow either a CLI or the GEM Desktop to be used as a development environment.

As for GNU C, the main thing I have against it is that it's hard to install and use. This is not surprising, in that it's a free offering. Free software is different from commercial software in that the latter is constantly driven towards increased usability by market forces. When I got Lattice C, I clicked on INSTALL.PRG and 10 minutes later I had a fully-configured and working compiler. When I want to know something about the compiler, it's likely to be in one of the nice easy to use typeset manuals that comes with the product. When something goes wrong, email to HiSoft gets me a bugfix or workaround within a day or two (which is, of course, much preferable to snide comments such as "the source is available, fix it yourself"). For this ease of installation and usage, and solid support, I paid $200. GNU C is free. You get what you pay for. Not everyone has $200 to waste on a compiler for hobbyist work. What they do have is time to just keep trying things until it works. My time (I felt) was valuable enough that the $200 for LC was a bargain.

Of course, I had to get into the exciting world of GNU C after all, since so many folks kept asking for GemFast to work under it. I have no doubt that in the fullness of time I will have found workarounds for all the little quirks and undocumented factors I keep running into. Until that full understanding comes, I'll continue to carp about the problems I have here. It works: I get answers (like the GNULIB thing) and better yet, so does everybody else. Maybe the folks reading this who'll be installing GCC next month will find the process a litter easier. Maybe somebody will break down and write a nifty install-and-configure program for it. Maybe somebody will create and post at a.a some nice easy-to-read ASCII docs for it.

Excuse me? As someone who created the first ST MAKE that works well from the desktop, as someone who just spent a week porting an even more capabable MAKE to the ST and retrofitting the desktop friendliness into it, as someone who, for chrissake uses MAKE to manage all his backups even, I can't quite see how I'm a person who doesn't believe MAKE is a good tool.

Are you serious ?
Do you mean you're convinced your Falcon is only putting pixels on the screen ?
Don't you know that all pointers are 32bits and (even worse) that instructions
can be advantageously read 32bits at once ?

Even with your 'exclusively graphics' application, I'm convinced a 32bits
access to memory would give you more than 50% speedup !!

The libraries with Turboass contain coded control definitions of the following calls 'ab GEM 2.0': appl_yeild, appl_bvset, menu_unregister, shel_rdef, shel_wdef, sgrf_stepcalc, xgrf_2box. I haven't been able to find any other references to these calls and I am curious as to what the hell they do. I got the impression, from something ger2eng translated, that gem 2.0 allows accesories to malloc more safely than before. Can someone curroborate this in a language I understand? I would also like to find a freeware multilevel popup menu library (source code).

Confusedly,
Jason

Source record: 38986

Dear Folks:

I seem to be having some minor, but annoying, trouble with my STalker/STeno link, which I am using now to write this onto a SUN Unix running ELM from my Mega 4 STE. I am running STalker 3.02, and STeno 2.0, "I" as the clipboard drive, both accessories OUTSIDE OF Multidesk Deluxe on a color system.

When I use STeno as a type-ahead buffer in this configuration, any attempt to use the "TAB" key results in a backspace when the line is transmitted, which can be disastrous when, for example, signing your name.

Also problematic is the fact that whenever I type a longish paragraph in STeno before hitting "return" and sending it through to STalker and the UNIX, the last part of the paragraph simply doesn't show up in STalker--no reason given. This isn't so much of a problem in typinglargK6;1HK7;1H

Also problematic is the fact that whenever I type a longish8;1Hparagraph in STeno before hitting "return" and sending it through to9;1HSTalker and the UNIX, the last part of the paragraph simply doesn't10;1Hshow up in STalker--no reason given. This isn't so much of a problem11;1Hin typing lar13;6H

Also problematic is the fact that whenever I type a longish paragraph in STeno before hitting "return" and sending it through to STalker and the UNIX, the last part of the paragraph simply doesn't show up in STalker--no reason given. This isn't so much of a problem in typing little notes such as this one, but if I want to edit a large text file in STeno and send it out through STalker--disaster.

As proof of that, witness the two truncated versions of the last paragraph above--one was plain "type ahead," the next "transmit selection," and third, which went through, was saved to my CodeHead ram disk and sent (by STalker) as a text file. How's that for a concrete demonstration of trouble? Where DID the garbage come from??

Anybody got any ideas (sorry about the 2 blank posts--editor bug)

Rob S. Rice

This isn't even TOS compatible.

Remember that on graphics cards, Logbase() does not necessarily point to the
screen VDI uses. It points to the screen XBIOS uses, which might be a different
one.

Gnu- Emacs 19 has multiple graphical windows (under X, when available)
Epoch-Emacs has multiple graphical windows (under X)

Emacs 18 has multiple windows (but text windows, tiled)

You can use Emacs on the atari, and I doubt it can't allocate memory
dynamically (especially considering it uses a garbage collector).
But of course, it does allocate a large amount of memory before even
starting to allocate any additionnal memory dynamically :-)

From: sourada@iastate.edu
Message-ID: <sourada.735782146@vincent2.iastate.edu>
Source record: 38891

For a program I'm porting, I need functions kbhit and getch. kbhit is supposed to see if a key has been hit, 'on the fly', and getch is supposed to get a key or wait for one if there hasn't been one.

I tried various solutions, some of which worked only with TOS, some only with MiNT running. Finally I tried this, it seems to work, but is it a good solution?

```
int kbhit(void)
{
return((int)Bconstat(2));
}

int getch(void)
{
return((int)(Bconin(2)&0xff));
}
```

(Of course, making them macros might make more sense, but that's not the point...)

> Falcon Setscreen() call

On the Falcon, there's an extra optional parm to Setscreen(). If the rez
parm (3rd parm) is 3, then the 4th parm is a shortword which is a mode-code
the same as that accepted by the Vsetmode() call. This is all full of
bitmapped options as defined below. The docs say using this type of
Setscreen() is preferable to using Vsetmode() because the Setscreen() will
reallocate the screen (possibly moving it!) as needed for the new mode.
To avoid macro conflicts with the old Setscreen() call, I decided to call
this new format Vsetscreen(). I cooked up a header file for handling the
falcon video stuff using Atari's examples and docs, it looks like this:

```
#define Vsetscreen(a,b,c,d) (short)xbios(5,a,b,c,d)
#define Vsetmode(a) (short)xbios(88,a)
#define Vmontype() (short)xbios(89)
#define Vsetsync(a) (void)xbios(90,a)
#define Vgetsize(a) (long)xbios(91,a)
#define VsetRGB(a,b,c) (void)xbios(93,a,b,(long)c)
#define VgetRGB(a,b,c) (void)xbios(94,a,b,(long)c)

#define VERTFLAG 0x0100 /* bit options for Vsetmode() */
#define STMODES 0x0080
#define OVERSCAN 0x0040
#define PAL 0x0020
#define VGA 0x0010
#define TV 0x0000

#define COL80 0x0008
#define COL40 0x0000

#define BPS16 0x0004
#define BPS8 0x0003
#define BPS4 0x0002
#define BPS2 0x0001
#define BPS1 0x0000

#define COLSMASK 0x0007 /* This is the bit mask for bit/plane #s */

#define MONITOR_MONO 0 /* return values from Vmontype() */
#define MONITOR_COLOR 1
#define MONITOR_VGA 2
#define MONITOR_TV 3
```

2443. GEMDOS standard handles

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-26 00:14:36 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Apr26.001436.24556@mnemosyne.cs.du.edu>
Source record: 38893

What is the deal with GEMDOS standard file handles? Folks are always asking me why my programs (such as make) can't handle I/O redirection, so today I tried to look into the matter.

It looks like handle 0 is both standard input and standard output. There is no standard error handle at all. How in the hell can you redirect standard input and output to files when handle 0 refers to both input and output? How can you redirect stderr at all?

I see that there are standard handles for MIDI and 'raw console'. I've never heard of anyone doing MIDI I/O using DOS-level file calls, is this an anti-feature, or what?

My guess is that the sensible thing to do would be redefine a couple of the useless standard handles like MIDI and raw console to mean stdout and stderr, but I can see that causing trouble if everyone doesn't cooperate. How do existing shells deal with this situation? (Speaking not of MiNT/MTOS, I'm sure they have very copacetic ways of handling redirection, which I will use when running under them. I need to know how to handle all this (as it were) on plain GEMDOS systems.)

Not quite. Handle 0 is standard input, and handle 1 is standard output.
It's true that a standard error handle isn't defined, but a lot of people
use handle 2 for standard error by putting something like:
if (isatty(2)) Fforce(2, Fopen("CON:", 1))
in their startup code. (Handle 2 normally points at AUX:, but few programs
do GEMDOS level I/O through this handle.)

> I see that there are standard handles for MIDI and 'raw console'. I've
>never heard of anyone doing MIDI I/O using DOS-level file calls, is this
>an anti-feature, or what?

There are BIOS level handles for MIDI and raw console, but not GEMDOS
level ones (correction: some versions of GEMDOS may have them, e.g.
MiNT does, but don't count on this existing in all versions of GEMDOS).

TeX doesn't use the FPU much, although Metafont will (which is used
only when creating new fonts).

WM>operations, and the 486 has the FPU built in).

There a almose _no_ floating point operations in TeX. TeX uses fix point integers, so a fpu doesnt bring that speed. I think the speed comes from the 2nd level cache of the 386 machine.

Hmmm....
I think the reason is that for MiNT >= 0.99 and especially for the filesystems things have changed a bit (Eric explained it in this group). Recompile the XFS with a new MiNT lib. (I have PL 30).

The new Setscreen calls should be documented in the Falcon developers manual.
GEMDOS 21 is probably Srealloc() (it's only implemented for OS internal use).
For details, take a look at the current MiNT sources.

From: itschere@techfak.uni-bielefeld.de
Message-ID: <C635vB.GKu@hermes.hrz.uni-bielefeld.de>
Source record: 38900

All these problems with MinixFS 0.55, mine does fine, except one: V2 completely trashed a disk when it's installed on aanything bitter than 64megs. It not only trashes if you acutally use anything above 64meg, but right at the beginning. V2 uses longs instead of integers as pointers, but obviously there's something wrong with it. Has anyone had THIS problem???

I have to disagree. No matter how much MiNT/MultiTOS slows you down, it is
unlikely (to say the least) that the system would cut away in between the
two commands (one to get the key and the other to check the status of the
shift key).

I mentioned this method because it would work in a TOS or GEM program. If
the program is strictly GEM, the best way to go would be to use the value
returned by the event handler handler, in which case you would not need
to call Kbshift() at all, since I believe (not positive) that the shift
key status is also returned.

Only the first few batches of STe's had that problem, and it only occured if
the DMA cable was longer than Atari had originally specified. So if it does
go wrong, try a shorter cable!

2456. Sound problems on new TT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-26 13:18:44 UTC
From: scott@dmi.stevens-tech.edu
Message-ID: <1993Apr26.131844.3871@dmi.stevens-tech.edu>
Source record: 38901
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

I have the following hardware problem. I recently put a new TT
into a German tower case made for holding a TT. After instalation of the
TT motherboard and all my drives the machine booted and worked fine.
The problem is that I managed to screw up the sound subsytem. I get no
keyclicks, bell or any audio.

I though the problem was the Yamaha chip as the tower case comes
with a front mount reset switch that clips a lead to the Yamaha. However
I replaced the yamaha chip and still no sound? Does anyone know how I can
go about finiding out what the problem is? bye the way I also get no ouput
from the two RCA jacks at the back of the machine.

Altough I do not use sound that much it is anoying to me that I
have a nice new TT with all the trimmings but a broken sound subsystem.

Cheers,
Scott. "scott@dmi.stevens-tech.edu"

2457. Screen Accellerators For Falcon....

>(by STalker) as a text file. How's that for a concrete demonstration
>of trouble? Where DID the garbage come from??

Rob: I'm not sure why TAB is getting converted to backspace... perhaps
it has something to do with the UNIX editor you're using. Make sure
though that "Expand tabs on Cut/Copy" is checked under STeno's Options
menu. When you select some text and cut/copy it to the clipboard,
STeno will expand the tabs into the appropriate number of blanks in
the text it puts in the clipboard.

As far as your typeahead problems go, make sure the "Send a <CR> after
each line" option is checked under STeno's "STalker" menu. This
causes STeno to send a CR after each line of a paragraph. Otherwise,
it only sends a CR after the entire paragraph (which is useful in an
on-line conference on GEnie/CompuServe/etc).

You might also want to consider simply using STeno/STalker's cut &
paste capabilities. The main advantage over typeahead is that when
STalker does a "Paste", it will follow the ASCII upload settings
you've selected, including things like line waits, host prompts, etc.
Text sent via typeahead or "Transmit selection" is usually sent at

full speed by STalker, although version 3.02 lets you control this
(see the README notes for 3.02 for more info).

> is no standard error handle at all. How in the hell can you redirect
> standard input and output to files when handle 0 refers to both input and
> output? How can you redirect stderr at all?

According to Atari, handle 0 is standard input, and handle 1 is standard output. By convention, handle 2 is standard error, _not_ AUX i/o (as declared by Atari; in fact, Atari recommends using the BIOS functions for AUX i/o, as far as I know).

Of course, handle 2 points to AUX i/o at boot time, so programs have to force it to the console if this has not already been done by some ancestor process. The MiNT library does this with the following piece of code:

```
/* if stderr is not re-directed to a file, force 2 to console
* (UNLESS we've been run from a shell we trust, i.e. one that supports
* the official ARGV scheme, in which case we leave stderr be).
*/
if(!*_argv[0] && isatty(2))
(void)Fforce(2, -1);
```

BTW, handle 0 is _not_ stdout, although in most cases you will be able to write to it because it's connected with the console.

>To avoid macro conflicts with the old Setscreen() call, I decided to call
>this new format Vsetscreen(). I cooked up a header file for handling the
>falcon video stuff using Atari's examples and docs, it looks like this:

[deleted some demo code]

Well, I already got that far by reading the docs, but I still do not
understand what Vsetscreen(0,0,3,0) and Vsetscreen(0,0,3,-1) do (note!
it *must* be 0 for your screen address, to force reallocation!). 0 is
no legal video mode on the falcon and -1 is usually ment for inquiring
the current video mode. Besides Vsetscreen(0,0,3,0) internally calls
Gemdos(21,..) --- I never got any docs on this call!

The reason for asking these questions is, that I try to write some
kind of software ScreenBlaster. I already figured how to set the
hardware registers and how to change the LineA variables, but the
current version of my program wastes an awful amount of memory, since
it is unable to force reallocation of screenmemory to the required
size. This is fine on my 14Meg Falcon, but it does not make this
program fit for distribution as freeware.

(BTW, I know, this program will be a dirty hack :-) So please do not
send any flames; it is just supposed to be a convenient tool that you
can put into your AUTO-folder --- if you have a F030, the F030 video
subsystem, either TOS or MTOS and an SVGA monitor, everything will
work just fine; otherwise do not install this program and do not care
about its dirty programming techniques...)

Hoping to get some info on these new calls...

Markus

Thanx, I will try to do so. Hopefully I will get the information I
need. Otherwise I have to stick to disassembling the OS --- grr, I
hate that... Atari really should have provided a call for setting up
an arbitrary screen geometry.

[Ian was asking for help on redirection of standard I/O]

If your program was written in C, I would recommend to link it with the MiNT-Libs. This ought to take care of standard I/O both for plain TOS and for MiNT. Besides you get closer similarity to BSD calls, so porting software is actually a lot simpler.

Markus

If it allocates a fixed amount of memory at startup and can't
allocate further memory, in what sense are it's internally memory
management schemes dynamic allocation? I can't run emacs because I
can't exit emacs and run fixstack every time I want to edit a large
file, and I can't tie up all my memory editing a few tiny files.
Emacs was not intended to run on machines without a brk call, and it

2465. Tech help on old 520 ST wanted.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-26 16:02:20 UTC
From: cse0080@desire.wright.edu
Message-ID: <1993Apr26.110220.8985@desire.wright.edu>
Source record: 38911

I have an old 520 ST upgraded to 1MByte of ram. It has been in storage for about 5 years. Recently I tried to get it up and running again as an educational tool for my children. The machine seems to almost come up, then I get two bombs and a busy-bee cursor that responds to mouse movements. (This is with no floppy in drive A. A TOS floppy goes into an infinite read from the disk/flash something on the screen/restart the boot process cycle. I have been able to get a game disk to come up completely, i.e. the game starts running (the game is Silent Service) The above indicates to me that most of the system is probably functional. I also have another ST box that I have used to swap chips that were socketted, and everything runs identically with chips from the other system (I *know* the other system is dead, killed by a power surge back in the days before I knew better.)

I would appreciate any directions to where I could look next. I have looked locally for people that service ST's, but no luck. I am comfortable mucking about in the hardware, but have no scope . . . . Also, if anyone has a functional ST box that they would be willing to sell FRC (for real cheap) I might go that route rather than continue to try to resurect (sp?) this one.

Thanks,

Karl C. Hansen
CSE0080@desire.wright.edu

Source record: 38912

> handle 0 is stdin, handle 1 is stdout, 2 is stdaux, there are no
> DOS-level MIDI and raw console handles.

Eric, I hesitate to question what you say here. Really I do. If anyone should know this stuff, it'd be you, I'd think.

But, it contradicts what (little) the GEMDOS manual says, and also what Mike Fulton told me a couple months ago.

The GEMDOS manual is where it says handle 0 is stdin/stdout and 1 is stdaux and 2 is stdprn. I can believe the GEMDOS manual is wrong (that'd hardly be a first, huh?). Mike Fulton is the one who told me about there being DOS-level MIDI and raw console handles, #s 4 and 5 I believe he said.

So the real standard handles are:

0 - stdin
1 - stdout
2 - stdaux
3 - stdprn
4 - ???
5 - ???

If 4 and 5 are so wasty, why haven't folks used one of them for stderr? Personally, I'm not fond of the concept of redirecting stderr anyway. I've always thought of it as a way to talk interactively to the user even when stdout is redirected. There are times when you want a program to be able to say something to the user no matter what the user has done with redirection.

50% speed up, you must be joking.

Not all instructions are 32bit, not all pointers are 32bit.
You are not taking into account the cache or the fact that the COBEL chip
which is on a 32bit bus makes up for some of the speed lose (there are obviously
no wait states between the 68030 and the COMBEL).

Also there is the DSP and BLITTER which reduce the load off the processor.
In addition the SDMA sound system requires no processing time for the output
of sound.

Within this architecture there is no way you'd get anywhere near 50% speedup.

Does anybody know how to write a mouse driver? I know it
invloves using XBIOS 0 (initmous). I'd like to make an assembly
language program that gets input from the MIDI ports and then
uses this input to drive the mouse. Thanks.

>
> But, it contradicts what (little) the GEMDOS manual says, and also what
>Mike Fulton told me a couple months ago.

The GEMDOS manual is wrong. Mike probably made the mistake of consulting it.

I have the GEMDOS sources open in another window as I type. Both old (pre-Falcon) and new (Falcon) GEMDOS set up the standard handles as follows:
handle 0: CON: (standard input)
handle 1: CON: (standard output)
handle 2: AUX: (serial port)
handle 3: PRN: (printer)
handle 4: CON: (undocumented)
handle 5: CON: (undocumented)

MiNT and MultiTOS do *not* set up handles 4 and 5, i.e. these are invalid handles. They've never been documented to be anything in particular, as far as I know. I think they were intended to be reserved for application use, in case an application wants to pass a file handle to its child. In any case, do not rely on these pointing at anything in particular when your application starts; it's entirely possible (probable, in fact) that earlier TOS versions didn't set them up, and future TOS versions may set them up differently.

(It's quite possible that we had planned to make handles 4 and 5 default to MIDI and raw console, and maybe we'll still do this.)

> If 4 and 5 are so wasty, why haven't folks used one of them for stderr?
>Personally, I'm not fond of the concept of redirecting stderr anyway.
>I've always thought of it as a way to talk interactively to the user even
>when stdout is redirected. There are times when you want a program to be
>able to say something to the user no matter what the user has done with
>redirection.

If you want to be sure of talking to the user, you can open "CON:" and write to it.

I think there certainly are times when it's useful to redirect stderr (e.g. to catch errors in a batch file). It seems that many (most?) ST programs use handle 2 for stderr, after redirecting it to the console.

That's not necessarily something that Atari can endorse officially,
but since it is a well-entrenched existing practice it's also unlikely
that we can change it.

A friend of mine tested that when he borrowed my Mighty Mic card earlier this year. I had fixed him some SIMMs and he had an Atari branded card so he tried them both. There were some differences, but hardly of any significancy to everyday life.

>- I heard that the MightyMic board was quite good, but it is expensive too.
> Is there any good reason for this high price ?

Well, The Mighty Mic is good but it caused me a lot of trouble, since the only type of SIMM they can guarantee works 100% is either Toshiba or Samsung. It took me several months to get hold of the correct RAM... Recently, a new player entered the market with a similar card. The difference is that it cost about 60% of the Mighty Mic card, yet accepts up to 128MB of SIMM using 16MB SIMMs (and it accepts any brand as long as it isn't Siemens). The Mighty Mic is only supporting 32.(Of course, they have a bigger card, but it cost $$$$). It has to be said that after this card made it onto the market, the dealer prices on MM cards has plunged, so it will probably be available cheaper than the normal DM700,- asking price. As for having such a high price - I don't know. The card is wery well done, the latest rev. is a beauty and it works fine. My only guess is that at one time they were the only player on the marked and they milked it for what it was worth...

Source record: 38925

Why won't gem work with mint030? Will it work if it is
started before mint? Is the problem that gem goes into other programs
memory for resources, or that other programs go into gem during
calls. If it is the latter, I wouldn't think gem would work under any
Mint. I assume that when a process makes a kernal call, or is
interupted, mint makes sure it has a legal pc (I know I've had
segmentation faults). So, when an application calls rscr_load which
calls Mint, why is there no fault? Also, it is possible that mint
would interupt an accessory, its memory is owned by the desktop yet

V>Ther's an acessory wich allows this, but in a slightly different way:
V>chameleon, from Julian Reschke (I think he programmed it).

Chameleon was written by Karsten Isakovic, NOT by Julian.

The main adv. of ACC.PRG is that it prevents you from messing up your root directory with lots of ACCs, e.g. when you use SUPERBOOT with several different setups.

V>What's better is that you can later unload the accessory and replace it by
V>another one.

I agree, but it's worth to be mentioned that this will fail with ACCs that do not use XBRA. I've had a lot of messages like "The Chameleon can't unload the ACC". :-(

Regards,
Andreas

>}

If your program does _any_ GEMDOS screen output at all, you should use the
GEMDOS function Cconis() and Crawcin() instead of BIOS functions - otherwise,
keys will be lost!
The problem is caused by GEMDOS having its own keyboard buffer which
is filled whenever screen related GEMDOS functions are called; the "lost"
keys might reappear _much_ later in another program that uses the GEMDOS
keyboard functions!
(As far as I know, this is no longer a problem if MiNT is installed...)

If your program is a GEM application (i.e. uses /any/ GEM AES functions),
you should use neither BIOS nor GEMDOS keyboard functions, since (you
guessed it...;-)) GEM AES adds yet another layer of keyboard buffering -
always use some evnt_multi() variant instead.
(MultiTOS may add further complications.)

```
< Now listen, I know EXACTLY what I'm talking about. And if we are talking
< about a TOS-SHOW-thingy (only scrolls in one direction, downwards)

Actually, no, that's not what the program does, it scrolls forward and
backward at variable speed, fully accomodating long lines (> 80 chars)
of *any* length. Meaning you can give it binary files if you want, and
you don't have to scroll sideways to see long lines. However you make
some good points, I'll comment below.

< you're TOTALLY wrong when you say an 8 MHz STE can't do fast smooth-
< scrolling using the method I described. Even if the scrolling is multi-
< directional you're wrong.
< .....
< To scroll anything
< on the screen without using lots of memory does automatically force
< you to update AT LEAST as much as you scroll.

True, but the route I took did use a user-selectable amount of extra screen
memory, so I didn't have to update and scroll together at all, until the
boundaries of the screen memory were reached, at which point I "batch"
the updates and redraw. This produces a small delay, but this can be
adjusted. I'll explain why I did this below.

< If you rely on using
< Timer B or HBL interrupts it's possible to make a scroller that is even
< faster than the one I've described (I think so at lest, haven't tried
< it myself). [strange algorithm removed]

Ok, but as long as you can keep up in the VBL's at a reasonable scroll
rate, without any delays, you don't need to go faster, as you mention.

< NO NO NO! I can't imagine where you've heard that an 8 MHz STE can't
< update 2560 bytes/VBI (16 pix high font in monochrome). It can probably
< update so much of the screen that you can scroll 1/10th of a screen 70
< times a second. That would mean 7 pages of text in one second. Is that
< fast enough?

Yes. There's not much point in scrolling that fast. I'll take your word
that you can update 2560 bytes/vbl (which of course in mono is all
single-byte writes). I think the discrepancy between what you're saying
and what I am is that my program makes some restrictions on the way text
is written because of the generality of the program. I was a bit hasty
in saying that some things were impossible. Perhaps you can write 2 lines
in mono per vbl, expanding tabs, if you can do a tight loop of just moves
to the screen, with no multiplies or divides. It is clear to me now that
the reason my text drawing stuff takes longer is some overhead per character,
```

not writing the character itself (which takes 16 instructions in mono). One
big problem is scrolling backwards over a long line, which is screwed up
by most text viewers. My program keeps no line data structures at all, and
the way it works, I never have to worry about where physical lines begin
(as opposed to logical lines). So how would you scroll backward by one
physical line with your algorithm? Where does the line start with lines
much longer than 80 chars? Remember there can also be tabs in long lines.
My program handles this completely, at the expense of not being able to
draw in the vbl while smooth scrolling. If you want to maintain lists of
pointers to the beginnings of all the lines, this takes time to calculate
also.

< Why would VT52 escape sequences make it much slower. You just don't use
< any of the code from the OS but write your own VT52-handling. The overhead
< per normal printable character would be very low.

Sure, checking for ESC is fast etc, but processing some of the codes is
slow, depending on which ones you mean. Also I can't see any point in
adding vt52, it's a text viewer not an editor. Haven't seen many files
with vt52 codes in them, other than some strange character demos. Inverse
video might be useful, but not many files have this in them.

< Every VT52-function would of course add quite a lot
< of overhead since the X-position would have to be calculated by multiplying,
< which is rather slow on a 68k.

< ....
< what about all who use MTOS?

Both of them, you mean? :^}

< What do you think
< they will think of your program when it screws up their desktop. I doubt
< they'll use it much! :(

I doubt it too. Considering that you need a TT or at least a Falcon to
effectively use MTOS, worldwide so far that's a couple hundred people.
And they don't make the TT anymore.

< Why don't you explain how your program works! It would make this
< discussion much more interesting. :) It's very possible that I've
< overlooked something that would make double-buffer technique impossible
< to use, but I can't tell unless you tell me what your program is
< capable of.

Well I have explained it by now, and I have no more time to type in big
posts. 8^) Maybe in a later version of the program I will try to optimize
the character loop, but I'm no demo coder and the program works well right
now. If you want to discuss further, let's use email...

That's what stderr is for - to talk to the user when stdout is
redirected to some file or to /dev/null. If the user has redirected
stderr, too, he does not want that messages - and in that case, I find
it annoying if the program finds some other way to print it.

>shift key).

The system probably wouldn't but that's not the problem: it's the delay
between the time the user pressed the key & the key got placed in the keybaord
buffer and the time I read the keyboard buffer & the shift-status. If this`
takes too long the user may have let go of the (for example) the Ctrl-key
and then there's no way to distinguise between Ctrl-M and Return.

BTW, I noticed TOSWIN sets bit #3 of conterm. Why does it do this?

Ta! Vince

Nope. Devices 4 and 4 aren't connected to anything (well perhaps to stdout, but
who cares).

>
> If 4 and 5 are so wasty, why haven't folks used one of them for stderr?

> redirection.

Because everything in the UNIX world relies on handle 2 being stderr. BTW: redirecting
stderr is very useful if you want to put error messages in a file (just an
example). When you want to talk directly to the user, you can still Fopen CON:, this
works with GEMDOS and MiNT.

>
Yes, but what if your code doesn't allow you to scan the keys instantly. Say
the first keypress causes a screen redraw, and the second keypress occurs
before this redraw has been completed. We're talking about situations where
the keys are being read from a queue, not directly from the keyboard - the
question is, are the shift statuses buffered as well. The answer is likely
to be no, since buffering them would lead to possible confusion (if you
didn't always read both queues together, for example)

>
I use this method in an editor in one of my programs, but it has (as far as
I can see) a problem. I use a two tables in reading the keyboard. The first
table contains pairs of evnt_keybd() return values to function numbers,
and the second contains pairs of function numbers to function pointers.
This way, I can simply dump the first table to disk to let the users
save their redefined key mappings. The problem occurs if I want to make
the help file reflect the new key mappings. In a system that returned
a code for each key on the keyboard, which didn't change if a control
key was pressed, and the control key status in, say, the top four bits,
I only have to store a small amount of text to describe the keys. With
the evnt_keybd() stuff I have to store a text string describing every
key combination, eg

<code for ALT + A> "ALT+A"
<code for CTRL+F10) "^F10"

etc.

Am I missing some simple work around to this?

>invalid handles. They've never been documented to be anything in particular,
>as far as I know. I think they were intended to be reserved for

As far as I know they are documented in the "Rainbow" TOS 1.4 Release Notes
to be CON:.

>application use, in case an application wants to pass a file handle
>to its child. In any case, do not rely on these pointing at anything
>in particular when your application starts; it's entirely possible
>(probable, in fact) that earlier TOS versions didn't set them up,
>and future TOS versions may set them up differently.

TOS 1.0 and 1.2 leave them uninitialized, but you can set them to CON: and
then pass it to your children (Use Fforce).
TOS 1.4 and higher set them to CON, so it should be a sensible idea to use
handle 4 for stderr. I think that would be the best way at all.

>(It's quite possible that we had planned to make handles 4 and 5 default
>to MIDI and raw console, and maybe we'll still do this.)

I don't think so.

>> If 4 and 5 are so wasty, why haven't folks used one of them for stderr?
>>Personally, I'm not fond of the concept of redirecting stderr anyway.

But the user can not redirect the errors! That's no good idea at all.

>I think there certainly are times when it's useful to redirect stderr
>(e.g. to catch errors in a batch file). It seems that many (most?)
>ST programs use handle 2 for stderr, after redirecting it to the console.

I think that depends on the C compiler used for compiling the program.

2492. WM_ARROWED bug! (help wanted)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-27 15:28:50 UTC
From: tose@brosme.dhmolde.no
Message-ID: <TOSE.93Apr27152850@brosme.dhmolde.no>

Since Atari doesn't seem to have any intentions towards fixing the very irritating bug that gives you two WM_ARROWED messages for each click I'm asking you guys how to fix this myself in my own programs. Should I use a timer to wait for a (possible) second message or what?

I know there is a program that fixes this bug (arrowfix), but I want my programs to work correctly with or without having this program resident..

At the moment I am using Tos 4.01 and 4.04 and they both still have this bug.

Please give me some advice here guys..

Cheers,

Torbjoern Ose - tose@brosme.dhmolde.no

> I use a timer to wait for a (possible) second message or what?
This is the way I do it:

If I get this message (evnt_multi) in my main loop I set a flag.
When I call evnt_multi there are 2 cases:
1) The flag is set
I ask for a timer event (t=0) AND a message event
2) The flag is unset
I ask for a message event.
(timer event only if you really need it. It cuts performance when you
have more than 1 application in multi-tos)

If I get the WM_ARROWED message AND the flag is set I ignore this message
and unset the flag.
IF I get ONLY the timer event I unset the flag.

This works with or without arrowfix.

With arrowfix the only problem could be that massages are ignored if
you click faster than the program can work.
I think tat's not a bug, it's a feature. But you can optionally
skip this algorithm if the user wants.

> [more details on standard handles]

Thanks, Eric. All this redirection stuff which I've been shunning for years because it's so confusing isn't really so bad after all. I've just been mislead by various conflicting docs.

Since we're clearing up bad documentation here, let me mention one more thing that might mislead some folks (it did me, briefly): that Lattice C manuals, in describing Fdup() and Fforce(), state that after redirecting a file using a sequence such as:

```
newhandle = Fcreate(newfile, 0);
oldhandle = Fdup(2);
Fforce(2,newhandle);
spawnl(etc,etc);
Fforce(2,oldhandle);
Fclose(oldhandle);
```

They say that there's no need to Fclose(newhandle); because the child process will have done so. That appears to be just plain wrong (thank gawd), you do need to close the newhandle. (Well, you can let it auto-close when your program ends, but that's sloppy. The point is, the termination of the child process doesn't auto-close a handle you opened, which is what the Lattice docs say.)

```

> to talk to the user, you can Fopen("CON:")

That came to me in a Blinding Flash of the Obvious yesterday. Except:
is it really necessary to Fopen() CON:? I just did an Fwrite(-1, ...)
in a place where I absolutely positively have to talk to the console
regardless of redirection. I figured that was safe, since -1 is supposed
to be an always-open handle to the console as near as I can tell. Is this
and unsafe method?

Also, what is the common syntax ST shells use for redirecting stderr? I
looked in some msdos source code, and it seems to support two syntaxes:

2> filename
>& filename

Is either of these the 'right' way to do it with ST shells? (The msdos
source also accepts 2>> and >>& to append, btw.)

Source record: 38843

```
> [double-scroll bug with WM_ARROWED messages]
> I want to put a fix in my own program.

This is simplicity itself, as it turns out: you just have to wait for a
double-click in your program, just once. I use the following sequence:

XMULTI xm;

xm.mflags = MU_TIMER | MU_BUTTON;
xm.mbclicks = 2;
xm.mbmask = 1;
xm.mbstate = 1;
xm.mtcount = 100; // 100 ms wait; don't use 0!

evnx_multi(&xm);

Just that simple act of waiting for a double-click in your own code seems
to clear up the double-scroll bug. You only need to do it once. I have
no idea why it works, it just does. :-)

You don't have to unless you really need to format HD disks from the
Desktop. There are lots of PD formatters around that format HD disks.

> - Change the WD1772 (or something like that) disk controller with an Ajax
> controller.

If you're lucky (like me), you don't have to do that. Just replacing
the drive did the trick for me. Most old 1772s can also be clocked at
16 MHz.

>BTW, I noticed TOSWIN sets bit #3 of conterm. Why does it do this?

TOSWIN doesn't set bit #3 of conterm. What it does is that it takes the key code and shift key status returned by GEM's evnt_multi, and passes them both to the program running in its window *as if* conterm bit #3 had been set.

Why does it do this? To solve precisely the problem that you were discussing: how to get shift key status in a multitasking environment. The solution is to do a Bconin() and to look for the shift keys in the highest byte. This will work under MultiTOS because your program will be in a TOSWIN-like window, and will work under normal TOS if you set conterm bit #3.

You don't need to use the multiply instruction, though...

>of overhead since the X-position would have to be calculated by multiplying,
>which is rather slow on a 68k.

Assuming an 8-pixel wide fixed-width font, the X-position is a one-to-one
correspondence with memory addresses. You mean the Y-position (vertical)?
You can get the Y position from a lookup table, and eliminate any need for
multiplication. This is the method I used in my optimizations to MiNT's
fasttext driver. This is also how I set up my putpixel/getpixel routines
in my old port of Fractint.

Too bad none of this discussion is applicable to a GEM-windowing environment.

They're probably fine. I think I always used Cconis() and Cconin(), since they use the GEMDOS handles and thus allow for redirection.

MSDOS - Just Say NO. You really need to go to The Source to find The Right Way to do things. In this case, the entire concept of Shells and I/O redirection, as poorly implemented in MSDOS, is merely a rip-off of Unix.
>
> 2> filename

This is the syntax used by the Unix Bourne shell. In fact, the Bourne shell lets you open any file descriptor this way, e.g.
n> filename, n< filename

where n is a single digit from 0 to 9.

> >& filename

This is the syntax used by the Unix C-shell. Note that when using this redirection, *both* stdout *and* stderr get redirected to the specified file. If you only want to redirect stderr, and leave stdout alone, you have to play C-shell games.
>
> Is either of these the 'right' way to do it with ST shells? (The msdos
>source also accepts 2>> and >>& to append, btw.)

Most ST shells try to emulate either the Bourne shell or the C shell. So, whichever is the correct syntax depends on which shell you're using. I would heartily suggest that you read the "I/O redirection" sections of both the Bourne shell and C shell manual pages. The Bourne shell is tremendously flexible in this are, the C shell less so.

I have TOS in rom, and I seem to recall that the machine should be able to come up without any disks at all. When that didn't work, I tried the TOS disk which goes into the infinite reboot cycle.

I have since tried another "non-boot" disk which has a file in the auto folder which initializes the time/date from a battery-backed chip (Timekeeper). With this disk, I can see the time/date initialization, then the system reboots again before the desktop comes up. Once again, I am in an infinite loop.

Could this be caused by bad memory?

If you want to multiply by ten, why not move to a temporary
register, shift the temp by 3, shift the original by 1, and add. To
multiply by 6 shift temp 2 instead of 2. Instant support for gemini's
8 point font. I wrote this longhand since don't know the details of
gcc inline assembly. I've never tried this, am I wrong thinking it
would work? It seems strange that the 68000 would take as long
multiplying by easy numbers as hard ones, and that assembly code could
work several times faster.

>and unsafe method?

It's safe as long as nobody has done an Fclose(-1). I would add the extra
2 or 3 lines of code to open CON:; it's better to practice defensive
programming. (Yes, Fclose(-1) *should* fail in most versions of TOS.
I wouldn't assume that all versions of TOS are free of bugs, though :-))

>
>As far as I know they are documented in the "Rainbow" TOS 1.4 Release Notes
>to be CON:.

I can't find this in my Rainbow TOS release notes; the only reference to "standard handles" I can find is a comment that closing a standard handle causes it to revert to its default BIOS device.

>TOS 1.4 and higher set them to CON, so it should be a sensible idea to use
>handle 4 for stderr. I think that would be the best way at all.

Except that no existing applications do this, and a lot of existing applications already use handle 2 for stderr. I suppose it wouldn't be the first time that Atari broke existing practice, but in this case I'd rather not; the gain wouldn't really be worth it, in my opinion.

I think it's actually quite useful for applications to have 2 handles which they can define for themselves and pass to children, and so unless some compelling reason comes along, handles 4 and 5 will remain undefined by the operating system and available for application use. If applications decide to use them for standard error output, fine; we're not going to stop them. But it is a bad choice, since no existing tools will write error output to either of those handles. And keep in mind that handles 4 and 5 are *not* guaranteed to point at CON: when a program starts, unless the program's parent has explicitly arranged for that to happen. (The same is true of handle 2 also, of course.)

This isn't "official Atari policy", because it's not written on paper. I would be highly surprised if any official Atari policy differed from it, however...

Can somebody tell me if there is a shell that will redirect i/o to modem?

Or is there any UUCP/MAIL software for the ST that will allow a bbs and its users to access the newsgroups, and email?

I know that HERMES will do this, the problem is making it possible for the bbs users to have access to it over modem.
Any help would earn major praise!

Thanks Alot!

A shell with redirection would be great, and a RN/NN type program would also be helpful.

>6--Green 12--Vertical Sync.
>13--Ground

Early 520 ST units have nothing on pin 2 and Ground on pin 8.

STMs and STFMs have Composite Video on pin 2.

STE assignment differs; no "General purpose output" there.

2510. UPLOAD: GEM++ v1.5 - Free GNU C++ GEM class library

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-28 02:04:48 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13143@uqcspe.cs.uq.oz.au>
Source record: 38860
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Available from atari.archive.umich.edu...
(in the /atari/Programming directory)

GEM++ is a class library for C++ that adds a layer of abstraction to
the GEM/AES/VDI system functions.

Included are all sources, makefiles, and an EXAMPLE program - ready compiled,
so you don't even need a compiler to see what it is all about. The example
program simply exercises a few of the features of the library.

A large range of classes are available, representing most of the GEM concepts:

FILE CLASS : BASE DESCRIPTION
-------- -------------------- ---------------------------------------
gemap GEMapplication - One for every program.
gemda GEMdeskaccessory
: GEMapplication - One for every desk accessory.

gemr GEMrsc - Loads and frees RSC files.
gema GEMactivity - A user interaction - the main loop.
geme GEMevent - A GEMactivity generates these.
gemfb GEMfeedback - The result of GEMevent processing.
gemks GEMkeysink - Key event consumer in a GEMactivity.
gemt GEMtimer - Timer event consumer in a GEMactivity.

gemw GEMwindow - Standard GEM windows.
gemf GEMform - Standard GEM forms / dialog boxes.
gemm GEMmenu
: GEMform - Standard GEM menus are forms.
gemhf GEMhotform
: GEMform - A GEMform that with extra features.
gemfw GEMformwindow
: GEMwindow, GEMform - A GEMform in a GEMwindow.
gemfiw GEMformiconwindow
: GEMformwindow - Iconifiable GEMformwindow.
gemd GEMdesktop
: GEMformwindow - Standard GEM desktops are forms.

img IMG - Standard GEM image format.

vdi VDI - Standard GEM vdi calls.

gemrawo GEMrawobject - GEMforms are made up of these.
gemo GEMobject - Extensible layer on GEMrawobject.
gemsl GEMslider
: GEMobject - A slider extension.

```
gemto GEMtextobject
: GEMobject - A text extension.
gemimgo GEMimageobject
: GEMobject, IMG - An extension that displays an IMG.
gemuo GEMuserobject
: GEMobject - Extension with user defined graphics.
gemvo GEMvdiobject
: GEMuserobject - User graphics drawn using a VDI.

gemal GEMalert - Standard GEM alert boxes.
gemfs GEMfileselector - Standard GEM file selector.

gemsb GEMstreambuf
: streambuf - Interprocess communication.
gemrec GEMrecorder - Records GEM events.

GEM++ has been developed with the GNU C++ compiler (G++), and so I can't
garauntee it will work on other compilers (but hey, if you manufacture a
C++ compiler for the Atari ST/TT, give me a free copy and I'll gladly
port GEM++ to use it!).

GEM++ is Free software, protected by the GNU Library General Public License,
which basically means you can use it for free, and even SELL it, or sell any
programs you write using it. You just have to distribute (or make available)
the ***GEM***** sources (not your own code) with the product. And you can't
get much fairer than that!

(MOST OF) THE NEW THINGS IN GEM 1.5 SINCE GEM++ 1.2:

- Detailed manual entries for every class.
- Added user-loaded RSC files (as opposed to GEM loaded single RSC file)
- Scroll bars now fully automated - even with GEMformwindow.
- Added new class: GEMformiconwindow - iconifiable windows!
- Vastly extended GEMslider interface - matches window slider conventions.
- Moved GEMmenu::DoItem(...) up to GEMform::DoItem() - allow the simple
interface of GEMmenu to be used on all GEMforms.
- Updated VDI to latest standard (thanks Bammi!)
- Added extension methods to GEMhotform.
- Added example desk accessory.
- Added new examples to example.cc.
- Improved overall consistency of filenames and classnames.
- Added etc/default.mak to avoid set-up problems.
- Top-level include file is now "gem++.h", not "gem.h".
- Added split main-loop to GEMactivity.
- Added direct-text and PRINTF-style GEMalerts
- Improved completeness of GEMevent
- Added GEMform::Map() - object traversal
- Moved GEMrealobject to own file, and renamed to GEMrawobject.
- Heaps of bug fixes, including bringing GNU C++ 2.3.3 compatibility.

Sorry I don't distribute GEM++ in patches yet. It has been quite dynamic
in the past - but is settling down a lot now, especially since I used it
```

to write my GEM port of NetHack.

Any help you need in setting up GEM++ or GNU C++, I'm right here on the net.

I've been trying to get at the GNU C and MiNT files from atari.archive for a long time now. I've sent out Email questions, and have sent all the proper mail with the "help" message as the FAQ said to do. However, I have been unable to achieve success.

Please help me by sending instructions on how to recieve files from atari.archive through Email and how to get some sort of file index. It would be greatly appreciated.

If you recieve duplicate postings of this message, send duplicate replies! Maybe I won't get them all! I'm going to try sending a copy of this to a bunch of places, so you may see it more than once.

Send all Mail to evanlang@sdf.lonestar.org

Thank You for any help you can send,
Evan Langlois

From: 01mbmccabe@leo.bsuvc.bsu.edu
Message-ID: <1993Apr27.225231.18770@bsu-ucs>
Source record: 38862

I am curious if there is a program (or just some way) to reset the archive bit on all files on my hard-drive so a backup program would back-up the entier hard-drive.

As it is, I've donea partial backup in the past so some of the files' bits are set so the backup program ignores them. Many of the files on the old backup disks (floppys) are corrupt so I'd like to start anew witha new batch of floppys.

Anyone?

-Matt

P.S. I'd like a bulk way of handling this rather than going through and renaming every file on my hard-drive, or some such thing. :)

>It's unlikely you'll find any advantage to "word bitplane" addressing
>over regular "single bit" bitplanes. Let's leave the generalizations
>behind and try the "real world" test. If you can show me an
>example...

Simple. Scrolling.

By using the movem instruction, you can easily load 48 bytes at a time into registers, then write 48 bytes back out. With word-interleaved bitplanes, in a 16 colour (4 bitplane) mode such as ST-Low, you can therefore move 96 pixels (96 pixels = 24 CONSECUTIVE words). With a bitplane-interleaved system, you must move 6 words of the first bitplane, then 6 words of the next, then 6 words of the third bitplane, then 6 words of the final bitplane.

See. Examples are easy. That's why I said there are Pros and Cons for each. But no, you just *had* to insist that one was absolutely better or absolutely worse than another. Oh well.

>In my terms that would be the "crippled word-interleave modes
>right up to 8 interleaved bitplanes and a crippled 16-bit (word-per-pixel)
>mode (because it doesn't have colour registers)."

How many video output systems have 128K of colour lookup table?????????????

Do you think 24-bit video is equally crippled? They NEVER have CLUTs.

Hence, it's a good idea not to bad-mouth software which you aren't fully
familiar with.

Is SunOS crap just because you have to set LD_LIBRARY_PATH in order
for it's cc/ld to find libraries? (no, it's crap for other reasons)

> I notice you didn't address my other recent comment about GNU tools that
>appeared in the same message: the librarian tool doesn't work well if the
>modules contain pathnames.

Simple because I've not done that. I don't know enough to comment one
way or another.

>As for GNU C, the main thing I have against it is that it's hard to
>install and use.

That depends how much freedom you want. I can set up a big huge ZOO file
with an entire directory structure, and preset environment variables for
you to work for that structure... but everyone has different requirements.
Do you want ALL the libraries? Do you want the sources to the libraries?
Do you want the sources to the compiler? Just the tools perhaps? And what
about Bison and Flex - those too? I think the MiNT Distribution Kit fills
this need.

>Free software is different from commercial software in that the latter is
>constantly driven towards increased usability by market forces. When I
>got Lattice C, I clicked on INSTALL.PRG and 10 minutes later I had a
>fully-configured and working compiler.

I believe the MiNT Distribution Kit has an INSTALL.PRG that has exactly
that purpose.

But really, IMO, if you don't go through the process of installing the
system yourself, you may find it difficult to install updates, or to
move it around when your physical system changes.

>work several times faster.

Actually there a whole theory about fast multiplication by small constants; its used by optimizing compilers. (see Bernstein, R., "Multiplication by Integer Constants", Software Practice and Experience, 16(7), pp 641-652, 1986). For example to multiply by 15 you can left shift by 4 and subtract off the original number.

The 68k mulu/muls instructions _are_ faster on "easier" numbers so you have to be careful that you optimization really is faster still.

These days I don't bother multiplying by a constant for screen addresses since I want my code to work with Falcon overscan and STe hscrolling. The ~12cy overhead is small if you only do one mulu/primitive and calculate all other screen addresses incrementally (I count an 80 char string as _one_ primitive).

If the serial port can be driven at 31250 baud, then all the MODEM 16+ needs
to do is convert RS232 signals (voltage levels) to MIDI (current loop). This
is only a couple of cheap components. As you state, you also need the
.DRV file for Cubase to recognise the port.

2522. MiNT libs and Floating Point

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-28 10:21:02 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <C66vF3.K2q@dcs.ed.ac.uk>
Source record: 38873

I have just compiled MiNT lib 30 on my TT,and while it seems to
have compiled O.K. , there are a couple of things I would like to know:

Firstly exactly what are all the .cpp software floating point
routines for and secondly is it possible to force the TT's 68882 FPU to
always be used instead?
The actual .cpp files themselves have #ifdef mc68881 statements in
them but they seem to be there to support a memory mapped 68881 such as the
ones that can be fitted to Mega STs and Mega STEs.
Finally , what is SFP004?

Thanks a lot,
Cheers,Joe.

2523. SCSI on the TT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-28 10:27:34 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <C66vpz.K72@dcs.ed.ac.uk>
Source record: 38874

Can anyone out there tell me where I can find some
info on the operation of SCSI interfaces, as I would quite
like to build some boards that communicate with my TT via
the SCSI port?
Also is it possible to access the TT's internal SCSI
drive from another machine connected to the external SCSI
port ? Also would it be possible, with the right software,
to send stuff straight into the TT's memory from another
computer connected via the SCSI port?

Hope someone can help,
Thanks in advance,
Cheers,Joe.

2524. REPLAY 16 hum problem

Source record: 38875
Cross-posted to: comp.sys.atari.st.tech,rec.music.makers

Hi,

I bought the REPLAY 16 package from Microdeal. REPLAY 16 is a 16 bit
sampling tool for the Atari ST. When I connect it up to my Yamaha MT3X
4-Track it causes a lot of hum. The input/output sockets from the
sampling cartridge are phono sockets and the I/Os to the MT3X are
1/4 inch jack sockets so I use gold plated 1/4 inch plug to phono
socket adapters to connect them up.
Is this hum caused by unbalanced impedance?
Anyone know how to cure it?

Thanks for any help,
Grant.

Yeah, that would be my guess. It seems to me like a faulty memory-cell in the system variable area (the first 32k of RAM) that makes the GEM crash during its initialization.
You say, you have TOS in ROM. Is it really ROM, or do you have EPROMs installed. If so, it could also be a wrong data bit there. Then you should probably try to reprogram (and then verify!!!) them.

A solution GUARANTEED to work is: custom sliders. BTW, make them
slide opaquely (i.e. have the contents of your windows scroll immediately as
you move the slider). No need to make your sliders white when your window
is in the background--- MultiTOS doesn't do this either.

[To see what I mean take a look at the modular control panel or my text
editress `Edith' who is available on a.a in the Editors folder]

2527. GFA Help! (Damned compiler!)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-28 12:25:39 UTC
From: ggranger@ersys.edmonton.ab.ca
Message-ID: <g2uP3B1w165w@ersys.edmonton.ab.ca>
Source record: 38877
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have the following GFA Basic code as part of a program to track
lottery numbers:

```
totalcount=16
DIM mstrip$(totalcount+1)
RESTORE strip_data
FOR i%=1 TO totalcount+1
READ mstrip$(i%)
NEXT i%
strip_data:
DATA Desk , Lotto 6/49 Tracker ,------------------,1,2,3,4,5,6,""
DATA Numbers , Get occurences , Enter lotto numbers , Check lotto numbers , Exit
,""
DATA "",""
```

Now, here's my dilemna. It works fine when being run in the GFA
Basic editor, but when it is compiled, it gives me an address error
(3 bombs). I don't understand why it would give me that error. I
have an OPTION BASE 1 statement in my INIT module (if that helps).
Any help would be greatly appreciated, as I am nearly to the end of
my rope with this bug.

MiNT 030 defaults to hardware memory protection turned on. GEM violates this, unless you have multiTOS, which is GEM fixed for MiNT.
Depending on which version you are using (you don't say), you can either start the program from a command line with a -m parameter, or rename the file in the AUTO folder from mint030.prg to mintnp.prg.

Niether of these will work on an 030 machine with version 0.9x of mint due to a bug prior to release 1 (which is now fixed).

>
> Can anyone tell me where to get a GFA BASIC compiler?

Well, you can always order one directly from GFA in Salem, Mass, by calling 1-800-766-6GFA but you will pay retail for it.

Other than that, any of the larger Atari dealerships should have it in stock. Places like TOAD, Mid-Cities, L&Y, Rising Star, Computer Studio, TCN, Micro Computer Depot, San Jose Computer, etc. Let me know if you need phone numbers.

This is given that you want the version 3 software, of course. If you are looking for the older version 2.0 compiler, call GFA directly. The GFA 2.0 compiler is _not_ public domain, contrary to popular opinion.

MIDI is just speeded up RS232 *BUT* try getting a 31250 bit rate
out of a standard RS232 port. It is not that the chip cannot handle it
but the clock applied to the chip is such a value that dividers in
the ACIA can produce bit rates of 1200, 9600 etc. etc. There is no
way that this frequency can be divided by a power of 2 to get the MIDI
bit rate. You will need a new clock frequency.

Maybe you could take a signal from the MIDI ACIA and connect it to
the modem ACIA and write your own driver and not use the modem port
for anything else and .... oh forget it.

>> [too bad handle 4 wasn't established as stderr]
> yeah, but no programs do that now.

True. I was thinking in terms of long ago, before anything was cast in stone by prior art. Of course, if we're wishing it had been done right long ago, we could just go ahead an wish Atari had made handle 2 stderr from the start. (Er, DRI really, since the original GEMDOS was their mess, as I understand it.)

I notice that the Lattice C startup code does an if (isatty(n)) Fforce(n); sequence on handles 2,3,4, making 2 stder, 3 stdprn, and 4 stdaux. I'm not sure messing with 3 and 4 are really needed, since I doubt many folks are redirecting print and aux from the command line, and it would require yet another conspiracy of agreement to make this all work anyway.

But using 2 as stderr does seem to be pretty universal in existing code; apparently all tools except HSC/dlibs are set up this way, and I'll fix those in the upcomming v2.0 release.

> but then the user can't redirect stderr!

I don't know why some folks can't understand that there are times you
HAVE to talk to the real user, not to some file!

Consider a backup program: it encounters a disk error, and it wants to
tell the user about it and ask the user whether to abort, retry, start
over with a new output disk, etc. You sure wouldn't want that message
going to a file, or that reply coming from a redirected stdin! Sometimes
only a human can look at an unusual situation and decide what to do next.

(Of course, I suppose the "unix way" to handle such things would be to
issue some sort of cryptic message like "output failed" then have the
program exit(1), and leave the user to puzzle out what happened. ::grin::)

I just tried to reproduce this bug, and I was successful. And when I tried to analyze where the bombs occurred, I was even more surprised: After inserting a diagnostic PRINT statement between all lines of the above program, the bug had disappeared -- no bombs anymore.
I can dimly recall that I ran into a similar problem quite a while ago, the exact situation escapes me right now. Back then, my solution was to insert dummy statements into the program until it worked, as far as I recall. I'm afraid the only "real" solution to such weird compiler problems will be to wait for the release of the Richter version of GFA basic.

[...]

>The more I use GFA Basic, the more I hate that stinking language!

Come on... the compiler is doubtlessly rotten, but the language
is one of the most elegant ones around. As an example, just
compare

```
DIM a&(x&,y&)
```

to:

```
int **a;

a = (int **) malloc(x * sizeof(int *)); /* this piece of code is */
a[0] = (int *) malloc(x * y * sizeof(int)); /* after an example given */
for (i = 1; i < x; i++) /* in some FAQ file about C */
a[i] = a[0] + i * y; /* off the top of my head */
```

I really do hope that the Richter version of GFA will turn out to
be as good as it sounds. At the CeBIT, I was thold by Mr. Richter
himself that the compiler they are building is based on the GNU
compiler. If they do that properly, we may soon see the
convenience of GFA combined with the power of GNU.

Definitely ROMS, or at least OTPROMS, They have serialized markings on them
and were purchased from an Atari dealer when TOS first came available in ROM
packages.

I have received a couple of Email messages that also seem to look mostly at
the RAM (Thanks for the responses, BTW). I would like to know if anyone has
a small program that could be used to test memory at boot up. It would need
to be written as an accessory or some such, cause the desktop won't come up,
but Timekeeper seems to come up and print to the screen before the reboot
occurs. If none such exists, I would pay $15 to $20 for a decent diagnostic
program that used direct screen prints etc. to help me track down the problem.

(I would write it myself, but have no way to generate a TOS disk/executable
. . . short of buying another system that is :-))

Thanks for all help.

>always be used instead?

Those .cpp routines are just standard routines that the GNU C compiler wants to have available. Also, they're really only used when the main processor doesn't directly support floating point math. When you have an FPU, most of those routines are omitted and the compiler uses the FPU instructions directly.

> The actual .cpp files themselves have #ifdef mc68881 statements in
>them but they seem to be there to support a memory mapped 68881 such as the
>ones that can be fitted to Mega STs and Mega STEs.
> Finally , what is SFP004?

Actually, the SFP004 is the memory-mapped FPU, the #ifdef mc68881 statements detail the support for the coprocessor mode FPU. If you look at it carefully, you will note that most of the files turn into empty code when mc68881 is defined, because, as I mentioned before, the compiler will use the FPU directly instead of calling these library routines.

If you want only FPU code, all you have to do is add -m68881 to the flags used to compile your libraries, and all code that you compile in the future. For the most optimal code generation, you should use the flag -m68020 to take advantage of the 68020/68030 instruction set, and -m68881 for the FPU instruction set. (Although, as I recall, setting -m68030 is the equivalent of setting both m68020 and m68881....)

Finally, if you don't want to have to remember these flags every time you compile, you can recompile GCC and change the definition of TARGET_DEFAULT in tm-atari.h. The current definition is 0, which means a plain 68000 with no additional features. See the file m68k.h for definitions of the values... You would probably want to set the default to 7, which means 68020, using bitfield instructions, with FPU coprocessor instructions... I think you may also need to make sure the CPP_SPEC defines the right symbols...

(Come to think of it, I'd say that whole default-setting section in the Atari GCC config file ought to get a little bit updated.....)

>
> They say that there's no need to Fclose(newhandle); because the child
>process will have done so. That appears to be just plain wrong (thank
>gawd), you do need to close the newhandle. (Well, you can let it
>auto-close when your program ends, but that's sloppy. The point is, the
>termination of the child process doesn't auto-close a handle you opened,
>which is what the Lattice docs say.)

Even in newer TOS versions (like 2.06), the I/O redirection code appears
to be _very_ buggy - for example, when a duplicated handle is closed, its
internal FCB (file control block) may become freed even though there is
still another handle pointing at it!
So it's quite possible that closing newfile causes some strange errors;
on the other hand, if you don't close newfile, it will be automatically
be closed when your program terminates - if the internal memory of the
FCB has already been reused at this point (possibly by some entirely
different data structure), _anything_ can happen - including a system
crash or the dreaded "System Halted" message...

Fortunately, MiNT appears to fix all these problems.

Apart from anything else, DON'T use tabs (^I) in anything meant to
be sent over a network. There's no guarantee that tab spacing
is the same on other terminals.

If you do it in your .sig, you'll end up in alt.fan.warlord sooner
or later.....

You should contact Atari because of this. As far as I know there aren't any
docs except the hardware infos about the TT's SCSI controller.

Hate to say it, but it's a pretty obvious error.

If you DIM a$(10), then elements go 0 to 9, NOT 10

you need

FOR i%=0 to totalcount

OK?

Source record: 38774

phruby@ucrengr (paul hruby) writes:

> Hi! I have a STe with 2mb of memory in it and would like to upgrade it to
> four megs. Could someone e-mail me complete instructions on what simms to
> buy, and how to install them? Thanks!

I'm posting because others may be interested.

OK, first of all this assumes that your STe is fitted with simms -
some early models were apparently fitted with sipps.

Your Atari has 2 1Mb simms fitted.

All you need to buy is 2 more. They should be 120ns or faster, and
it doesn't matter whether they're 8 or 9 bit. Just make sure that
they're a matched pair.

You'll probably find that the cheapest simms available are 1Mb x 9,
70 or 80ns, as these are used in the majority of PCs these days...

Open your STe by unscrewing the 7 screws holding the case shut.
(They are the ones in the square cutout holes. The round cutouts
are for the floppy drive mounts)

With the machine's keyboard facing you, lift the keyboard and swing
it to the right. The power supply is under a cover at the left rear
of the machine. You need to remove the 4 or so screws holding the
cover down and straighten the retaining clips. (Needle nose pliers
recommended.)

Once the cover is removeed, the RAM becomes obvious - its just to
the right of the power supply, almost in the middle of the case.

Keep one hand on the steel shield at all times while doing any of
the following steps, or wear a wrist strap. Ram is relativley
insensative to static electricity but there's no sense taking
chances and having to buy new simms or a new computer.

Tilt the existing simms forward. (Front one first) Use tweezers or
a small screwdriver to ease the simms out of the clips each side of
their sockets. (Be careful - if you break the plastic clips you'll
have to replace that socket).

Insert the new simms in the 2 spare sockets, and Tilt all the simms
back into vertical position. (Rear one first.) Be careful in case
you break the clips - make sure each simm is seated properly BEFORE
you swing it back. Don't use excessive force.

Don't handle the simms by their contacts. Apart from the static danger, oil from your fingers can contaminate the simm contacts, making the memory unreliable sometime in the future.

Power up your ST and make sure that it behaves and the extra memory is being recognised. There are memory testers on atari archive. Beware of the power supply - there are LETHAL voltages exposed there, and it's surprisingly easy to accidentally put your hand on it.

Once you're happy it's all OK, put all the covers back, and replace all screws. Be careful not to strip the plastic mounts.
(Best way to avoid that is to turn the srew backwards till it 'clicks' into the old groove and then tighten it up.
DON'T OVERTIGHTEN - fingertight is fine)

Retest.

If you're not happy with any part of the procedure or feel unsure about doing it yourself, take it to a tech. (Along with these instructions if needed.)

Have fun.....

>there some thing
>: more to it.

>MIDI is just speeded up RS232...
NO! It is not.

MIDI is a *5mA Current Loop* system. The input receiver is a current detector, not a voltage-level detector. You need an opto-isolator on the MIDI input. This provides better electrical separation between MIDI devices, reducing the chances of mains hum.

For a circuit diagram, look in some old MIDI book. Some people recommend one by a chappy called RA Penfold, but I have not seen the book myself. I don't think I have the circuit diagrams for the interface any more.

Some RS232-to-MIDI interfaces are a little more sophisticated, and can communicate with the host computer at rates other than 31250, doing data buffering where necessary. The price of the MODEM 16+ implies that it does not do this; it would seem to be a simple current-loop/RS232-level converter.

2556. Ghostscript and ATM

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-29 12:23:37 UTC
From: y0000028@ws.rz.tu-bs.de
Message-ID: <1993Apr29.122337.8105@ibr.cs.tu-bs.de>
Source record: 38751

Help!

I copied some pfb files used with ATM to my Ghostscript
font folder and installed the fonts in fontmap, but i can't
use them.

Every time i'm going to find a font i get a loading message
and than an /undefined in ... error, where ... is something
barely readable.

To use the fonts i removed some character before the %!PS,
but i changed nothing else.

The ATM (Adobe Type Manager?) is supposed to be a simple
Type 1 font rasterizer, I believe. How does he cope with these
fonts?

BTW, the fonts came as an archive which unpacked without error.

Many thanks in advace

Axel Kielhorn

How to get gofer.zoo from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp ftp.cs.ruu.nl [131.211.80.17]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
Don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get pub/ATARI-ST/lang/gofer.zoo

(or first cd to the directory, and then get the local filename part, to
avoid "permission denied" on your system)

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!sun4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/lang/gofer.zoo
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

>who cares).

Handles 4 and 5 are not connected to nothing (double negation!). Since TOS 1.4 they are connected to CON:.
Handles 4 or 5 cannot be connected to stdout, because stdout is a standard handle, too. Standard handles are connected to file handles or to device handles.

>my rope with this bug.
>
```

Your menu data string in the 3 DATA statements at strip_data has 18 elements but you are only reading in 17 of them, thus not getting that all important last "" which tells GFA the menu build is complete. If you had set OPTION BASE 0, then all the data elements would have been read because you would start counting from 0, not 1. So change OPTION BASE to 0 (or totalcount to 17) and try that.

Also, each of the menu items you have specified in the 3 DATA lines should be enclosed in double quotes to denote them as string variables.

SCSI I and II specs are out there in networld; some friendly
archie near you will be glad to help 8-) You might also try to
stop by at comp.periphs.scsi and ask for help there.

> Also is it possible to access the TT's internal SCSI
> drive from another machine connected to the external SCSI
> port ?

It's possible, but you need arbitrating hard disk software
for that to prevent collisions on the bus. AHDI does not
arbitrate on the SCSI bus, my (beta) driver does; I don't
know what other HD drivers do.

> Also would it be possible, with the right software,
> to send stuff straight into the TT's memory from another
> computer connected via the SCSI port?

Of course, the SCSI port can be used to read data into memory,
but there must be some software in your TT requesting or
awaiting data transfers from the SCSI bus.

: not do this; it would seem to be a simple current-loop/RS232-level converter.

Not correct! You need more than a simple voltage to current loop
convertor to change 38400 baud to 31250 - that is assuming you can
get 38400 out of the ATARI modem clock.

You should contact Atari because of this. As far as I know there aren't any docs except the hardware infos about the TT's SCSI controller.

If you are a registered developer, They will send you the docs you need. They don't come in the standard DOCs bundle, so you will have to ask for them specifically.

From: sourada@iastate.edu
Message-ID: <sourada.736123407@vincent2.iastate.edu>
Source record: 38764

I want to verify that I have the correct idea of the GCC calling conventions
in the ST version. (I can't seem to find anywhere that documents this, I had
to hunt around in tm-m68k.h...)

Args are pushed onto the stack from left to right, big-endian.
Functions need not save d0 d1 a0 a1 a7, but (in general) must save
a2 a3 a4 a5 a6 d2 d3 d4 d5 d6 d7.
Return value in d0.

Thanks,
Steven Ourada

2569. Ram ugrade for 520 ST, HELP

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-30 02:24:10 UTC
From: automan@stein.u.washington.edu
Message-ID: <1rq2kaINN4t2@shelley.u.washington.edu>
Source record: 38766

Ok all you Atari Hack-Masters, here is the deal. Me and a friend have two Atari 520 STs, very old. We also have the four original SIMM modules from my 1040STe.
So, the questions is, how can we upgrade one of the 520's to one megabyte of memory using availble materials (these aforementioned). RISK is no concern, but we would like to able make the thing work after the operation.

One old magazine I read a an article that mentioned piggy-backing additional memory chips on top of the existing ones, but the article was in no way detailed enough.

GRAND PRIZE: My eternal and undying gratitude.

Thanks in advance,

Roger McGhee
(automan@stein.u.washington.edu)

2573. Does evnt_timer() what it should?? HELP needed!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-04-30 07:55:55 UTC
From: kolodzie@uni-duesseldorf.de
Message-ID: <kolodzie.57.0@uni-duesseldorf.de>
Source record: 38768

Hello, out there,

I am using an 1040 ST for a laboratory experiment, which needs accurate timing (pauses in the range of seconds and minutes). To do this I took the evnt_timer() function, which appears to do sometimes anything else but precise millisecond timing. For example, a 10 min. delay (evnt_timer()-parameters appropriately set) may (not always) last for about 12 seconds !!!! Is this a common "feature" of evnt_timer(), is it a system failure (TOS 1.2) or have I to obey any rules in using evnt_timer ?

If you have any idea, please mail to me directly, since I do not follow the list regularly.

Thank you in advance.

>get 38400 out of the ATARI modem clock.
Actually, I *was* correct. If you read my posting again, you may notice that
I said that a cheapo device must be operating the serial port at the same
speed as MIDI, in which case current-loop/voltage-level conversion *is*
sufficient. I *did* say that any device which operates the serial port at
rates other than 31250 will need some buffering.

My understanding was that the serial port interface chips can be programmed
to run at 31250, although I do not have the docs at hand to verify this.

Interestingly, some newer MIDI modules come with an RS-232 serial port in
addition to a MIDI port, allowing connection to MIDI-less PCs. If you
have one of these devices, then, with a Cubase driver, you already have access
to two `MIDI' busses.

If I remember correctly, mstools is a fairly old ms-dos compatibility package, I believe it has some problems of it's own. I would suggest getting and installing mtools, a freeware ms-dos program suite for Unix machines, it compiles no problems on Sun/DEC and many other hosts and has been working well here for months.

I 'm not sure I've actually used it to write disks I subsequently read on an ST, but I've had no problems reading, writing & formatting ms-dos disks that are usable in a Unix box or a PC equally easily. Also, I have never had any problems reading PC 720K disks in my ST, so I think mtools could solve your problems.

It's available from loads of archive sites, eg gatekeeper.dec.com in the states and src.doc.ic.ac.uk in the Uk (check with archie to be sure).

Hope this helps,

AH>the ACC". :-(

Those accessories are bad stuff anyway - an ACC that hooks into system
vectors will crash the system when the resolution is changed. This may
not be such a big problem on STs, but on TT and Falcon there are many
different resolutions and you might want to change these more often.

I believe there is a memory allocation bug in the latest version
of the GFA compiler. I can think of one person at least (Hi Andre 8-)
who is desperately waiting for a bug for this, as he gets a fair
number of complaints about his program crashin, and its not his fault.

Can anyone tell me how I configure the ST's serial port from C or assembler? I need to be able to set baud rate, word format, parity etc, and perhaps the size of the buffer associated with the port, though this is of less importance.

Before you ask, I'm just writing a MIDI <-> serial converter so I can plug it into a Sun and dump/load/process midi data from there.

email preferred, thanks

Maybe this is where we misunderstood each other. Electrical or data
buffering due to the different bit rates.

: My understanding was that the serial port interface chips can be programmed
: to run at 31250, although I do not have the docs at hand to verify this.

This is the one (and only) point I am disputing. From what I know of
ACIAs on OTHER computers (and their clock rates), it is NOT possible
to get 31.25 kBd out of a standard serial port.

BUT - try this for size: Say the port is set to 19.2 kBd and the 16+
contains an ACIA with TWO clocks. It could clock in the data at 19.2
and, when the buffer is full, the output side of the ACIA could clock
it out at 31.25. This would just leave slightly longer gaps in the MIDI
data in the event that multiple messages need to be sent at the same
time - I doubt if anyone would notice this. And, because the 16+ is
output only, there would not be the problem of bufferin MIDI input.

> out of a standard RS232 port.

No it isn't. MIDI is a current-loop interface, i.e. goes by absence/presence
of *current*, whereas RS232 is a *voltage* interface, swinging between
nominal +/-12 volts. You can easily convert between them, but they are
not the same, transfer speeds aside. If you hook em together, one or more
of the ports will fall over go boom. :}

Date: 1993-04-30 22:50:44 UTC
From: likos@clinet.fi
Message-ID: <1rsag4INN3af@clinet.fi>
Source record: 38786

I have some problems with Harlekin Version 3.0, who has installed it
successfully for MultiTOS Version 1.0 (not Beta-Test)???

I don't know where to search for the bug!

Is it...
my 14 MB Falcon?
Is it... MiNT?
IS it... the multitasking AES 4.x?
Is it... Harlekin 3.0?
Or what else?

I have in the AUTO-folder only MINT.PRG (sometimes also SPDGDOS.PRG) and few
Accessories (XCONTROL.ACC,ALERT.ACC,HARLEKIN.ACC[HARLEDFP.ACC]), nothing else
and while booting I get the following message:
"pid 4 (newdesk) memory violation,type=private,AA=1EF76C,PC=27CF6,BP=1B0000"
Harlekin 3.0 works (except some serious bugs) on Falcon's TOS 4.1(not MultiTOS)
Has someone got is working on Falcon with MultiTOS 1.0 and if yes, what should
be modified (maybe some lines in GEM.CNF or MINT.CNF, some SETENV, or what?)??
be

Or maybe some parameters in "Einstellungen" or "Vektoren"
but what exactly should I change??

I have a german version from Maxon...
Please, reply to my private email address, thanks...

I can't imagine that. Although I never tried it...

All people I know had big problems with the 32MHz accelerator boards
because the Blitter didn't work at 32MHz. And it was impossible to
simply disable it, because there are _no_ routines in the TOS for doing
BitBlits by software instead by the blitter.

W>Huh! You're obviously still talking *fixed-width* fonts.
W>I want proportional-spaced fonts for MenuBar titles and items. No
W>reason why they aren't possible.

Using other fixed fonts then 8 or 16 rows on the desktop is possible, at least und MultiTOS. An if i wasn't too lazy to finish my translation of the manual and do some fixes, you could do this under any TOS version. This means a complete change of the AES system font. Additional access to GDOS fonts in the desktop's windows would be even nicer, of course.

Using proportional fonts is not recommendable, since the editable fields in dialog boxes will not work anymore. If you want to rewrite the objc_edit- routine of AES, tell me ;-). But you'd still have to use specially adapted fonts. Fonts with and average width of 8 and max width of 24 f.e. simply kill the AES.

Well, let's not get overly general here. Maybe all unix compilers limit
you to that. Certainly all ST compilers I've seen do. But on MSDOS, I
have six compilers that allow you to specify left-to-right, usually by
either declaring the function as __pascal, or by using a command line
switch.

Have you confirmed that Blitstat() doesn't work in all modes, or does it fail only in 256-color modes? I have this sneaking suspicion that maybe the blitter was never designed to work in 256-color mode, and thus it is either slower than software in that mode, or perhaps doesn't work at all, and thus Blitstat() doesn't let you turn it on in 256-color mode.

The blitter must always be on, because the Falcon VDI has to use it
(unlike older VDIs which had software blitting code as well; there wasn't
room in the Falcon ROM for the software blit code).

>Also, the blitter is automatically (by TOS) switched off at
>256 colour mode. Does this make sense?

No, the blitter is on... perhaps whatever program you are using is reporting
the blitter state incorrectly.

NVDI solves this problem, you can switch the blitter off with
the NVDI CPX.

It doesn't repond to blitstat(). You get return the blitter status
but not change it, unless you have NVDI installed which mysteriously
cures the problem.
The most annoying part is that if you switch to 256 and then back
to 16 or mono, you are left with a disabled blitter with no way
of switching it back.

Well, my own program says it's off. The NVDI control panel
says it's off and it feels like it's off. Unless using blitstat()
as on all previous versions of TOS no longer works.

The monitor must have either ECL inputs or analog, but then you'll have to use
a converter box.

First of all check if the monitor is capable of 75 kHz hor. scan freq. and 72
Hz vert. scan .freq. Otherwise it wouldn't sync on the TT's high rez video
output.

good luck - Peter

>Is this hum caused by unbalanced impedance? Anyone know how to cure it?

Probably caused by mains interference (is the hum 60 Hz?).

If so, connect the computer and the sampler unit to the same mains outlet.
If there's still a hum, turn one of the mains plugs 180 degrees.

good luck - Peter

I've just installed MultiTOS onto my Mega/STE 4 and it works fine with Harlekin II... but it doesn't work with Warp 9! The Warp 9 AUTO prog comes up OK, but the Accessory says it hasn't been installed and there isn't any acceleration. Anyone any ideas? Running MultiTOS without it is murder!

Also, changing the GEM.CNF ACCPATH (or whatever its name is) doesn't make AES load accessories from another directory (eg. C:\ACCS). Any idea on that one?

Otherwise I do like MultiTOS, especially now I've managed to get a version of DeskTracker to work under it!

>

Hmm, you are confusing the BIOS/XBIOS device numbers with the GEMDOS file handles. According to my trusty "ST Internals", GEMDOS has the following standard handles layout :

0 : Console input (stdin)
1 : Console Output (stdout)
2 : Serial Interface (AUX)
3 : Printer Interface (PRN)

It says handle 2 was meant to be stderr (With AUX and PRN shifted over by 1 place) and 5 as null, but that it was incorrectly implemented on the ST. (why ??). Now, these handles are to be used with READ()/WRITE() only, not the XBIOS functions. Thus,by way of DUP() and FORCE(), you can redirect both stdin and stdout independently (And it works, I did it once to get a quick printout of the output of one of my programs, as a little patch-in.)

> I see that there are standard handles for MIDI and 'raw console'. I've
>never heard of anyone doing MIDI I/O using DOS-level file calls, is this
>an anti-feature, or what?
>

These are definitely the XBIOS devices. The "raw console" is the same as device #2 (for output), except that no VT52-like handling is done on the data. That's why the character sets include graphics for the low numbered values. They can be displayed by this device.

> My guess is that the sensible thing to do would be redefine a couple of

Ah, but there are some times (and some programs) that you'll _need_ to.
If I run POV-Ray in the background, I have to redirect stderr as well...
It displays its credits/copyright message to stderr. Easily fixable,
but also easily dealt with by redirecting stdout and stderr.

> to other modes from 256

I finally got around to trying this just now, using:

printf("mode = %d\n", Blitmode(-1));

No matter what mode I'm in, it always reports 3 (blitter available and
being used, according to my docs). It's even on in 16bit color modes.

I'm running RAM-based TOS 4.02 still; I wonder if the TOS version has
anything to do with it?

Well, I can't argue with that. Until I just ran the little program to
report the Blitmode() return value, I was fully willing to believe it was
off in 256-color mode, based on how friggin slow the desktop is in that mode.

You get HSC140.LZH from a.a, unpack it, and run INSTALL.PRG. :-)

HSC v2.0 is going to be ready inside a month (hopefully sooner, I'm about
to start contacting my trusty beta testers to see if they're ready for me).
The main difference between v1.40 and v2.0 is that the latter will support
external names up to 22 chars long, instead of the old 7-char limit.

In article <C6CtA6.ts@brunel.ac.uk> cs89bsm@brunel.ac.uk (Brendan S McEnroe) writes:
>Where can I get a good PD Ada compiler?

Eventually, the nearly fabled GNU Ada front-end that's under
development will become available on the UNIX platform. At that
point, it may be possible to interface that front end with the Atari
GCC system, and run it on an ST.

It's not unlikely that it will require lots and lots of memory, and
may not run on anything less than a 4MB machine. I wouldn't be too
surprised if it would require a Falcon/TT.

But the point is moot in that there is, to my knowledge, NO Ada
compiler of any description currently available on the Atari ST.
(Whether people would or should WANT one is an entirely other issue,
that would be appropriate to alt.religion.computers...)

Thus the simple answer is, you can't get one now.

It is my experience that "unlikely" events happen more often than you
expect! Besides, I'm not fond of techniques that rely on the speed of the
machine or the fact that a context switch is "unlikely".

I do recall that there is a documented way to get bconin() to return the
keyboard shift status in the upper byte of the returned word. I think it's
done by setting one of the system variables at $400-$600 (my documentation
is at home). Quite how this works under MiNT is anybody's guess.

> issues about redirection and programs writing to stdout/stderr

Actually, now that I've got PAMAKE supporting redirection (and thus for the first time I'm actually using redirection on the ST), I'm starting to wonder what's the right way to do things in HSC, in terms of what handle I write to for what sort of messages.

While at first blush it seems 'obvious' that errors should go to stderr and everything else to stdout, this sort of forces a user to redirect both of them, and to different files at that since it doesn't seem to work when you try to redirect stdout and stderr to the same file. It seems especially useless to have stdout contain a log of progress (listing all the commands MAKE is running, etc) but then if an error happens it's recorded in a separate file. I'm tempted to just make everything go to stdout so that you have one log of what happened, and if there's an error message, it'll be at the bottom of that log.

Does anyone have any thoughts or preferences on this sort of thing?

Source record: 38814
Cross-posted to: comp.sys.atari.st.tech,gnu.gcc.help

I have been attempting to set up my Atari STe to use gcc 2.3.3. To test whether I had all the core files, I tried writing the infamous, "Hello, world," program. It worked -- until I tried being a bit fancy.

By adding "#include <stdio.h>" at the start of my hello.c, I caused the following error messages. (Trying to write other programs that used the .h files gave similar results.)

Command (from gulam):
gcc -o hello.tos hello.c

Result:
In file included from d:\\gnu\\include\\stdio.h:11, from hello.c:1:
d:\\gnu\\include\\compiler.h:177: parse error before character 032
In file included from hello.c:1:
d:\\gnu\\include\\stdio.h:108: parse error at null character

The include files in question came from atari.archive.umich.edu in an archive called includ87.zoo. If anyone has a suggested fix, I'd appreciate it. (I have a reasonable understanding of C from PC and Mac systems, but no experience with gcc.)

I'm preparing to do alot of TOS and GEM programming, and HSC no longer suits my needs, and MWC never did suit my needs. I'm going to go for GNU C, but I noticed there were ALOT of different files.

I'm definately going to be using MiNT, and I'll be getting the distrib-kit over the next few days, but what I need to know is what is necessary for GCC, and C++. I'll be grabbing the MiNT lib too, but again, there are a million different ones that seem to be the same version. And some things are listed under GCC but don't seem to be part of the compiler. Can someone tell me the bare minimum required?? I mean, do I need all those Update files? What about all that stuff in the New directories?? What's the current version of GCC, and are there any docs on how to set it up? and what files are required if there was a doc telling me what was required I could use that to find the other files.

Any help would be greatly appreciated. Thank You.

: >BitBlits by software instead by the blitter.
: NVDI solves this problem, you can switch the blitter off with
: the NVDI CPX.
The Speed is not the problem, because the entire system architecture runs
with the original Speed with only one exeption: the CPU ;-)
The real problem is the 24-Bit Adressrange of the Blitter. No one at ATARI
considerd a machine, that uses a Blitter AND a alternative RAM above 16MB.
The Blitter can not be disabled by a Switch (hardware-register or similar).
The NVDI is just better programmed than the VDI so the Blitter is really
slower than the Software.

I'm not sure whether there is a general rule on what should go to stdout and what to stderr. When considering some specific program, however, one can always have a look at the respective standard document, or, if there is no standard, at the manual for a comparable Un*x program.

In the case of Make, the POSIX 1003.2 standard draft 11.2 states in section 6.2.6: "[6.2.6.1 Standard Output] The make utility shall write all commands to be executed to the standard output unless the -s options was specified, the command is prefixed with an at-sign, or the special target .SILENT has either the current target as a prerequisite or has no prerequisites. If make is invoked without any work needing to be done, it shall write a message to the standard output indicating that no action was taken. [6.2.6.2 Standard Error] Used only for diagnostic messages."

Section 2.11.6.2 [Standard Error] describes what "Used only for diagnostic messages" means: "[...] *Default Behavior*: When this subclause [Standard Error, --M.H.] is listed as ``Used only for diagnostic messages,'' is means that, unless otherwise stated, the diagnostic messages shall be sent to the standard error only when the exit status is nonzero and the utility is used as described by this standard. i> somebody will break down and write a nifty install-and-configure program
i> for it. Maybe somebody will create and post at a.a some nice easy-to-read
i> ASCII docs for it.

Just a quick offering to those who may be struggling - I almost cried the other night when my seemingly-perfect installation wouldn't work... All the binaries were on the path, etc etc etc. When I invoked gcc, it would return silently (no error messages) without doing anything... Turned out that the GCCEXEC env var was wrong (/usr/bin/gnu/gcc- as opposed to /usr/bin/gcc/gcc-) and the driver couldn't find any of the compiler passes.

Now, it works fine...

>==

This not overly general, since the C language requires right to left args
pushing to accomplish function calls with a variable number of arguments.
This is not demanded by Kernighan/Ritchie or ANSI C as far as I know, but
the compiler would have to push another argument specifying the length of
the parameter stack to do it with left to right args.
Some compilers use registers to pass parameters for speed reasons, but
they fall back to right to left stack passing whenever recursion or variable
number of arguments are encountered.
Some compilers have special switches or keywords (definitly NOT standard)
to offer a convenient interface to other languages (like PASCAL), but I am
sure, that some PASCAL-compiler somewhere has a similar feature to change
parameter sequence without changing the fact that PASCAL parameter passing
is done left to right (I could be wrong about that, but the meaning should
be clear).

> description of use of stdout and stderr in MAKE.

Actually, it wasn't MAKE I was concerned about, it was (as the message stated) the compiler pieces that make up HSC. MAKE itself is pretty easy to figure out: if it's not an error, it goes to stdout.

The compiler pieces, as I inherited them from when they were Sozobon, had a funny mix of stdout/stderr usage. Since the way I always used them involved stdout and stderr being the console, it didn't really matter. Now that my new MAKE enables I/O redirection for desktop users, it has become an issue. All the compiler pieces, for example, when invoked with -v, write their version message to stderr. I've changed that to stdout. Some calls are a bit harder. LD, invoked with -v -v outputs extra info about what it's doing, to help you identify problems during the link. Should that go to stdout, or stderr? (I decided on stdout, for no good reason other than it isn't actually any error message being output.)

Using unix docs to decide on the behavior of Atari ST programs strikes me as a mixed-bag concept. First you have to have the unix docs, of course. Then, I guess you have to think unix is something worthy of emulation. Actually, given a choice, I'd tend to look to other ST tools first, like Lattice C. In the absence of that, I'd go next to MSDOS prior art. Wherever possible, however, I try to do things that won't disorient anyone, be they unix-head or msdos'er or GEM lover or Macintosh worshiper or whatever. Rather than worshipping at the alter of some arbitrary standard I prefer to make things easy for everyone, to whatever degree possible.

> gcc "parse error before charcter 032"

I get that too, and it drives me nuts. What's happening is that your files are terminated with a ^Z character -- just like the GEMDOS document says a text file should be. But, GCC doesn't recognize this as EOF, as it should reasonably be expected to do.

When a file is read using translated stream input, a \r\n is translated to a \n, and a ^Z should get translated to EOF. Given that Atari has defined that GEMDOS-based text files use \r\n line terminattion and ^Z EOF markers, any software that runs on an ST should be able to handle text files in that format.

I've been informed that GCC reads input files in binary mode, not translated mode, and that's why this problem happens. I asked a couple C language lawyers about this, (one of them was on the X3J11 committee), and they said that while GCC isn't technically in violation of the standard for behaving this way (nothing says a source code file is a text file, and nothing says it has to be read using translated stream input), they also pointed out that a compiler that can't handle text files formatted as defined by the host filesystem "is clearly a bad implementation".

Anyway, if you can set your editor to not output ^Z at the end of the file, that will fix it. If you can't, I have a little program called NUKEZ that will strip the ^Z of the end of all files matching a wildcard mask in the current directly. I can mail it to you if you need it.

Thanks for the offer. I got a reply via mail earlier that pointed me
at a program called st2unx that fixed some of the problem --
specifically, the message you quote above (which came from compiler.h).
It didn't, however, fix the "null character parse" problem. I think my
next step is to look at stdio.h with a byte editor.

I've been editing using the built-in ue inside the gulam shell. Is
there another editor that will write out files as gcc wants them?

Just to belabor the point mercilessly, these *are* files direct from
the archive, theoretically part of gcc. Why would *they* be
incompatible? Is my zoo extracter doing funny things to the text
format? (I wouldn't have expected it to play with the line or file
terminators.)

2624. Calling a shell from a program

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-03 21:40:50 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993May3.214050.20909@mnemosyne.cs.du.edu>
Source record: 38826

The Lattice C runtime library has an interesting description of its system() function. Apparently it attempts to pass the command to the resident shell/CLI if such is available. Since I'm not a shell user, I'm curious whether LC's system() command is gonna be compatible with the shells commonly in use.

It first checks the _shell_p system variable. If this is non-NULL, it jumps through that vector passing a pointer to the command string as the only arg. (This seems dangerous as hell in a memory-protection environment, but maybe shells don't actually set this vector anyway?)

If _shell_p is NULL, it looks for a SHELL= environment variable. If there is one, it starts the named program, passing -c followed by the rest of the command line. If there is no SHELL= variable, it looks for COMSPEC= and if that exists it starts the named program, passing /c followed by the rest of the command line string. If it can't find a shell by any of these methods, it attempts to spawn() the command.

The COMSPEC= is MSDOS-compatible, so I don't expect any ST shells will support that (ST shells being mostly unix-oriented from what I gather here). I'm curious whether the _shell_p and/or SHELL= methods are compatible with the shells in ST land? And is the notion of passing '-c' as the first arg proper for these shells, as a way of saying "run the command(s) on the rest of the command line, then return to me"?

This is, of course, for my new PAMAKE program. I have a little pseudo-shell built in the program to handle common commands such as rm/del/delete, cp/copy, echo, cd, and so on. For the commands it doesn't recognize, it attempts to spawn() the program of that name. This works great for GEM desktop users, and pretty good even for shell users since there's no need to spawn a shell to handle a simple file deletion. But, there are gonna be times when your shell can do things that the builtin interpreter can't, or will do them differently, or you just want/need to use your shell instead. So I've made it such that you can stick a .NOCLI: pseudo-target in your makefile (or in MAKE.INI to have it in effect all the time), but I want to make sure that Lattice's system() function is going to hand the commands off to existing shells properly.

With NVDI installed, you CAN switch the blitter off by calling
xbios blitstat(). Don't know how they did it, but it works.
It doesn't switch NVDI on and off, it actually toggles the blitter.

Gulam's ue will write files out correctly. If you go to then end of any file with this problem, you'll see a "^Z" sitting by itself on the last line of the file. Delete that line and resave the file.

It must be your version of zoo. I created this archive on a Unix host, which does not use any EOF markers of any kind. I have just now verified that there are no Ctrl-Zs in the archive itself.

Not in this case. I just created a test.c with the single line,
"#include <stdlib.h>". I had not previously done anything with stdlib.h
except extract it from the .zoo and copy it to the include directory.

I received the error:
In file included from test.c:1:
d:\\gnu\\include\\stdlib.h:61: parse error at null character.

I edited stdlib.h using gulam's ue. No control characters were
displayed. At the bottom of the file was a single blank line (i.e.
a new line after #endif /* _STDLIB_H */) I hit F3 and <BS> a few times
in case there was something invisible there causing problems. I saved
the file and recompiled.

Same error.
>>
>It must be your version of zoo. I created this archive on a Unix host, which

Actually, I have no evidence that there are Ctrl-Zs in the .h files.
It may be that something else causes the same symptoms that others
have had with EOF. If I were to pay attention to the compiler error
(usually not a good idea, I know), I'd think it was upset about the
presence of binary 0. Of course, I don't see any of those in ue
either.

[buncha errors]

You might want to see if it's a problem with CRLF vs. just LF. When I had a problem (somewhat) like this, I seem to remember it was complaining about continued lines (i.e., lines with \'s on the end), and when I changed the files to CRLF's, it worked OK (I think).

Before I figured that out, I used MiNT whenever I wanted to compile with GCC, and that worked...

From: cse0507@desire.wright.edu
Message-ID: <1993May4.005115.9180@desire.wright.edu>
Source record: 38839

Hi, y'all:

Anybody got a *ptr on how to convert numbers from Intel to Motorola format
and back again? I'm using Microslosh C7 at work, Lattice C5 at home, and the
binary data files are garbage when Lattice reads them. This includes
ints, shorts, and floats. I know about swab(src,dest,count) in Lattice, but it
doesn't work on floats...as near as I can tell. Ideally, the Atari port of
the program will read the Intel format binary files, internally convert them,
and be capable of putting the same file back out again, if necessary.
MSC7 ints are 16 bit, Lattice ints are 32 bit. Lattice shorts are 16 bit,
both float sizes are 4 bytes. EMail is ok, code fragments are better. :-)

P.S. I *assume* it's an Intel-->Moto problem, not my code. :-) I'll test that
assumption tomorrow.

]here). I'm curious whether the _shell_p and/or SHELL= methods are
]compatible with the shells in ST land? And is the notion of passing
]'-c' as the first arg proper for these shells, as a way of saying "run
]the command(s) on the rest of the command line, then return to me"?

The _shell_p and SHELL= methods are well-known ways of finding the shell.
At least does gulam and the GP-shell support this usage of _shell_p;
and i think gemini does as well. The SHELL= with -c is like the standard
UNIX convention. See man csh, man sh etc.

I am NOT trying to start a religious war about which alter to worship, I am only trying to make a suggestion.

As Ian already points out, the two major decision factors should be good reasons and minimizing disorientation, rather than simply clinging to some arbitrary standard at all costs.

But in the absence of The Obvious Correct (tm) thing to do, I would like to advocate a little for keeping up with the unix way of things, at least with I/O redirection. At least the MSDOS sense of redirection is modelled after unix (Microsoft actually was busy selling unix, when IBM asked them to do DOS), and there is a lot of PD unix programs out there, and for instance makefiles often assumes that everything follows the unix standards. So porting these becomes easier when The Way (tm) is somehow unix-compatible.

Moreover, since we have many unix programs ported already (all the gnustuff, fileutils, make etc.), and since MiNT (in my understanding) has long gone the POSIX way, I do think that unix is a not so bad standard to look at when making design decisions.

The above does however shoot me in the foot, as there really is no critical need for making your make program unix compatible, since we already have GNU make for those who needs the unix way. So if there is any other (non-unix) way to go, by all means do that. The most important thing is still to *think* rather than just standardize.

>
>Ofir ogal@cix.compulink.co.uk
>
Well the blitter doesn't have an on/off switch; switching it off simply means setting a flag so that different drawing routines that don't use the blitter are called.

The fact that the Falcon does everything with the blitter worries me:
Imagine of full screen scroll (at an ST resolution). Thats about 32K word accesses which would lock the processor out for 16mS on an ST. Thats one of the reason that most MIDI packages won't run with the blitter on the ST; MIDI interupts have to be serviced in <320uS. I wonder if things are better organised on the Falcon or whether the blitter is constantly running in half speed mode (which would explain the reported sluggishness of 256 color displays).

A reasonable C stdio library returns EOF if you are at the end of the file :-)

There's no magic involved. Switching the blitter on or off has nothing to do with hardware, it's just a flag for the lowlevel VDI routines (in Atari's VDI: Line-A). Using NVDI on a Falcon, you can switch off the blitter, because NVDI has all the functions in software, too (actually, running faster than the Falcon blitter). Atari's VDI hasn't the soft blit code, so you can't turn off the blitter.

: One rsconf() and that's it. NDA prevents me from giving full
: details. Why not buy the unit, it is not too expensive.

: Ofir ogal@cix.compulink.co.uk

Thanks Ofir. Actually I DID buy one several months ago and am very
happy with it. I am just joining in the debate about how it might
work in order to get some more insight into the workings of the ATARI.

Your clue about the rsconf() made me realise that the modem port does
NOT use a 6850 ACIA and this puts a different light on things. The fact
that the transmit clock comes from one of the timers makes virtually ANY
bit rate possible. However I cannot see how this can be achieved via
the rsconf() function as all 16 possible values for 'baud' are
allocated to standard RS232 bit rates.

BTW I am very disappointed with the instructions of both the 16+ and
CUBASE in that NEITHER explain just what EXPORT is. I mean: what do
Xport2 etc. address and, what's more to the point, how can I write
s/w to send SysEx to the devices that I have connected to my 16+ ?

Regards,

John.

Hello,

May I ask you netters for an opinion?

I have a five year old, barely used SLM804 Atari laser printer, which I would
like to sell to someone interested.

What price would YOU be prepared to pay for that printer?
Please respond by e-mail to the address below, as I DO NOT read this newsgroup.
(Though I still have my 520st ...)

Thanks for the answers.

Regards Robert

>d:\\gnu\\include\\stdio.h:108: parse error at null character

The same happened to me. Now, I know what's going on: check your environment-
variables, especially TEMP.
If you have a backslash at the end, e.g. "setenv TEMP d:\temp\", remove it.
If not, append one (I know it was the backslash, but I can't remember if
it has to be there or not; just toggle the appearance of the backslash)
For me, this "patch" worked well...

>> [description of GEMDOS text file standard]
> Please inform use where the official Atari docs document such a
> strange behavior.

Glad to. The Atari GEMDOS manual, the one that comes with the
developer's kit. It's got funny page numbering, but it's on the sixth
page after the title page. The section is titled FILE OPERATIONS. The
paragraph reads:

GEMDOS places no restrictions on what a file may contain. Most
applications assume that text files contain lines separated with
carriage-return linefeeds, with a control-Z indicating the end of file.

I believe this has to do with GEMDOS's MSDOS heritage. I would have been
perfectly happy with a more strongly-worded standard that said lines are
delimited by linefeeds only, and there is no EOF character (^Z or
otherwise) in the file. It sure would make text processing easier. But,
we're still living with restrictions and decisions that must've seemed
like a good idea to them in 1985. ::sigh::

I really do wish the GCC lexer could be taught to ignore ^Z. It's a
character that has no lexical meaning in C source code on any system, so
it seems harmless enough to have it be ignored if present. (Well, I guess
the right way would be to have it turn into an EOF token rather than being
flatout ignored, but even that shouldn't be too hard.)

Actually, I think if you look at Lattice C v5 stuff, I think that you will
find that they based their make on how UNIX make behaves. In fact, when
Alex
from HiSoft visited Atari, we asked him for documentation on their make. He
directed us to the UNIX documentation that is available from most computer
bookstores.

So, I would say that basing tool behavior on UNIX behavior might not be
such
a bad idea. It certainly can't be any worse than basing it on compilers
that
have long since vanished from the earth.

You might check on this but the COMMAND.TOS or COMMAND.PRG that Atari had
originally distributed with the Developers Kit probably supported the
COMSPEC
method and the shell_p method of finding the shell.

I know for a fact that Gulam supports shell_p.

For more info you should contact midihelp@cix.compulink.co.uk.
Vic has the docs and may be able to help. Export2 and 3 are for
compatibility with C-Lab Export which uses the serial port to
give 3 MIDI outs. This is not very successful, timing errors, etc.

"Strongly-worded standard" ? I think the words "GEMDOS places no restrictions on what a file may contain" is pretty well worded. To me it means that there is *no* specification on internal format of a file. The GEMDOS document does *not* say "what a text file should be" - it says "most applications *assume*" thus and such, but there are no Rules to enforce or to violate.

Actually, I've seen source code that contains Ctrl-Z characters embedded in character strings. I would hate to see them fail to compile just because the preprocessor decided to stop reading at that point. By rights, control characters should *never* have any meaning when stored in a file. By actual definition, they are *terminal* control characters, and have no meaning

except as part of a communications protocol, going to some kind of TTY. This is the only proper way to interpret them. As an example, some folks have the misconception that Ctrl-D is "the EOF character in Unix", and that this is somehow reflected in the files stored in the Unix filesystem. In fact, Ctrl-D is merely a flag to the terminal driver, nothing more. On MSDOS systems, the standard input routine recognizes Ctrl-Z typed from the keyboard as an EOF signal. That's fine. But again, the Ctrl-Z doesn't appear in the input stream. (Try "copy con: junk.txt" some time from the DOS shell, type some text, then a ctrl-Z. Look at the file that's produced - no embedded Ctrl-Z.) Control characters have no legitimate meaning except when transferred over a communications line (e.g., dumb terminal, console keyboard, etc.).

>
>P.S. I *assume* it's an Intel-->Moto problem, not my code. :-) I'll test that
>assumption tomorrow.

For integers it's simple, you just need to do a complete inversion, e.g.,
hex digits AABBCCDD become DDCCBBAA for a 4 byte int, or AABB -> BBAA for
a 2 byte int. For floats, it depends on the floating point representations
used by MSC and Lattice C, respectively. If both are using IEEE 754 compliant
floating point arithmetic, then a 4 byte swap ought to do the trick. (I don't
have a reference for either of them, but I'm pretty sure that both *do* use
the standard IEEE representation.) I bet your problem is that the Lattice
swab routine is only performing a 2-byte swap, and you need to swap all 4
bytes in a float.

If I were writing this code, I would perform the byte order conversion on
the Intel box. Not because I think one system could perform it more quickly
than the other, but because I look at things from an internet networking
perspective, and the internet standards define canonical byte ordering to be
big-endian, i.e. Motorola format, and it is always the responsibility of the
non-standard machine to convert its output data into a standard format. It's not
the responsibility of a standard machine to have to know how to cope with a
non-standard format.

On a typical Unix box with internet protocol support, you would use the macros
ntohl and htonl, ntohs and htons defined in <netinet/in.h> to do your
conversions. ("N to H" means Network to Host order & vice versa.) Instead of
conditionalizing your own code, you simply use these macros, which themselves
are conditionally defined, doing nothing on big-endian machines, and doing the
appropriate swap for little-endian (e.g. Vax, Intel) machines.

>of GCC, and are there any docs on how to set it up? and what files are required
>if there was a doc telling me what was required I could use that to find the
>other files.

The current release version is GCC 2.3.3. Get the file gcc233b.zoo from the
archive and read the Readme file contained therein. That will tell you what
other files you need. I have posted that file to this newsgroup before, but
rather than repost it this time around, I'm just telling you that it's there.

As for all those Update files - all the updates have already been applied to
the packaged files on the archive. The updates are being archived separately
as a convenience for those folks who already have a working GCC installation
and don't need to transfer the entire distribution anew.

Did you check out your setting of UNIXMODE?
I had similar problems with an other program some time ago
and when I removed UNIXMODE from my setup everything worked fine.

The program in question was compiled with gcc!

Very true Howard. However I have found that most Windows programs do not
support Motorola formated numbers in files conforming to the Microsoft
Standard. MicroSoft did define that any file can in either format, and
it is identified by the first four characters of the file.
(RIFF = Intel formatted numbers; RIFX = Motorola formatted numbers)

A per a previous post (I really do like to repeat myself) post a few
Microsoft file formatted sound and picture files in RIFX format, get
a few friends to praise them, and watch tons of complaints come in from
people whose utilities do not support the standard.

That is a frightening thought.
I do run Cubase with the blitter on (on a Mega ST) and I didn't
notice any problems. I haven't had a chance yet to put the Falcon to the
test.
Also, many synths and samplers have delays in excess of 20ms between
receiving MIDI and responding. Notably, Akai samplers are very good
at 3ms response time. The worst thing is that response times are not
consistent and depend on number of notes, etc.

Just as an aside, VAX is worse than little-endian. Also, if you use a VME serial interface card such as DR11-W or BIT3, then the swapping is different than if you use sockets. The bottom line is you can use the defined byte architecture to make your first cut, but the correct byte swapping is the one which works correctly in that implementation.

BTW, good point about it being the responsibility of the non-canonical architecture to convert to canonical. Another benefit of being a Moto kind of guy :-)

(Concerning funny parse errors on gcc .h files.)

Ken Newman of Mississauga, Ontario. (Yeah, Canada.)

If the last character of your environment variable TEMP is a backslash, like the gulam samples show, (Boo, gulam) then gcc gets upset and blames the error on its .h files. (Boo, gcc) Odder, still, that gcc installation documentation says nothing about using TEMP, but rather tells you to set TMPDIR. (Boo, again, gcc)

But thanks to everyone for their suggestions. I learned about a lot of new utilities, libraries, and ftp sites from this.

As a general convention, redirecting stderr drags stdout along with it.

for example, if one were to say

make all >&logs/make.log &

to any vaguley unixish shell, one would reasonably expect to find a complete transcript of the make in the appointed logfile.

Commodore as a monitor for the Amiga. It has inputs for TTL RGB,
analog RGB, and even NTSC.

The question: Will it work (in color mode) with an atari ST?

Part of the problem is that the ST puts out Hsync and Vsync
separately, and he says the monitor is expecting a composite sync.
Can these be tied together with a diode, or is there a "better" way?

I do know that the monitor is capable of displaying the required
resolution (640*200, 4 colors).

Thanks for any info! Please mail replies to mgm@world.std.com, so I
don't miss them - I'll post a summary to the newsgroups in a day or
two.

The following 6 messages contain an article which describes the NAPLPS protocol for on-line graphics in complete technical detail given the limitations of ASCII. This document is based on the official CSA/ANSI/ISO specifications documents but attempts to use more normal terminology and clearer examples.

NAPLPS is a graphics protocol meant to be used over point-to-point links like modems and is designed to be efficient enough to be useable at 2400 bps. Currently it is used by Videotex services and Prodigy but more and more BBSes are using it as well. There is not yet any freeware source code available for a NAPLPS terminal server so I wrote this document to help interested programmers get started.

I would like to see some free source code developped on the net so that it can be ported to the large number of Atari, Apple II, Amiga, C-64, C-128, etc. computers to enable them to find a second life as terminals.

X-windows is not normally used over modems because of the overhead in the protocol. I suspect that the NAPLPS technology could be used to improve X throughput in an environment where the terminal server runs on a UNIX host and transmits NAPLPS over a modem link instead of using a frame buffer on that host. This should provide good performance as long as bitmaps are not required to be transmitted, so it will not work for any X-client but it should extend the range of usefullness of X.

I have started a NAPLPS area on SIMTEL20 and over the next month or so, a variety of MS-DOS shareware supporting NAPLPS will appear there including 3 shareware terminal programs, 1 shareware drawing program, 1 shareware BBS, and several utilities for image format conversions. I just checked wuarchive last night and it is in mirrors/msdos/naplps. This document will also be going to SIMTEL20.

------------------------------------------------------------
DISCLAIMER
This document is NOT the NAPLPS standard. The standard is
defined in an ANSI/CSA document which can be purchased from
one of those organizations. If you are creating commercial
products based on NAPLPS, then you should buy those
documents. This document is intended to clarify the
standards document and present the information using a
clearer terminology than in the standard. If there is any
conflict between this document and the standard, then follow
the standard and let me know so I can correct this document.
I take no responsibility whatsoever for any errors,
omissions or opinions in this document. It is NOT intended
as a guideline for creating commercial products, it is only
intended as an educational document for those who are unable
to obtain the standard or unwilling to decipher its
terminology.
------------------------------------------------------------

This is a specification for the on-line graphics format
known as NAPLPS. These specs are based on the ANSI/CSA
standards document that defines NAPLPS which is available
from ANSI (American National Standards Institute) as
document # X3.110-1983. They have offices in many American
cities and their head office is in New York. The identical
document is available from the CSA (Canadian Standards
```

Association) as document # T500-1983 and supplement # 1-1991. Note that the supplement (which clarifies proportionally spaced text among other things) is not available from ANSI. I have also gleaned information from a 4-part series of articles published in Byte magazine in February, March, April and May of 1983. There are a total of 55 pages in the 4 articles. I have also used the MGE editor and PP3 terminal program from Microstar to experiment and figure out the details of the coding scheme. As far as I know, PP3 is the only shareware NAPLPS terminal program that fully implements the NAPLPS spec including DRCS (redefinable fonts) and bitmaps.

My knowledge of NAPLPS comes from many sources. I first read about Telidon in 1979 or 1980. I was able to use Telidon demo systems several times including one short layover at Vancouver International airport in 1982 when I spent 3 hours playing with a public Telidon terminal. It would have been a boring 3 hours without that system. I also have the official CSA specs. I have used the MGE editor and used it to create test images to poke around in with DEBUG. I have some Japanese utilities to print out a text version of NAPLPS codes and reassemble into NAPLPS from the text specs. I have the BYTE articles. I have used the PP3 terminal program and CTLINK and Turmodem. And I have a collection of images from Japanese ham radio operators and Montreal schoolchildren and from various NAPLPS services. You should note that this spec is NOT the definitive spec. I am writing it for electronic distribution in order to encourage more people to produce software that supports NAPLPS graphics. I hope that some of you will use it to create NAPLPS utilities, write NAPLPS doors for BBSes, add NAPLPS support to your terminal programs or BBS software, etc. At the end of this document is a resource list with phone numbers and Fidonet addresses where you can get more info and samples of NAPLPS art.

Overview

NAPLPS

NAPLPS (North American Presentation Layer Protocol Syntax) is a communications protocol that extends ASCII to allow for the EFFICIENT transmission of picture and text information over telecommunications channels such as modems. It does not contain the commonly used ANSI protocol but it does include similar capabilities and it could be used simultaneously with ANSI although most NAPLPS terminal programs do not currently support ANSI.

A NAPLPS image is transmitted in a manner that is independent of the resolution and color capabilities of the receiving display. There are NAPLPS terminal programs available for Amiga, Macintosh and PC's with CGA, Herc

monochrome, EGA, VGA and other display resolutions.
This is accomplished by sending instructions to the
terminal program that tell it how to draw the required
pictures and text. Even bitmap pictures are transmitted in a
scalable fashion.

OSI
The OSI (Open Systems Interconnect) model of data
communications divides up the various aspects of an
electronic conversation into 7 layers. NAPLPS is a protocol
to be used at level 6 which is the presentation layer. Such
things as error-control are handled at lower layers and user
interaction is handled at level 7 (Application Layer).

APPLICATION - this is the interface provided by the
actual application program or BBS system.
PRESENTATION - this layer encodes, transmits and
decodes data in such a way as to
preserve its meaning. Examples are
ASCII, ANSI, NAPLPS
SESSION - this layer establishes and maintains a
communications session. This is the process
of logging in and presenting a password.
TRANSPORT - This layer provides a virtual circuit
from terminal to host. Data could travel
across several different networks in lower
layers.
NETWORK - This is the layer where routing, switching,
bridging and gating occur.
DATA LINK - This layer handles flow control, error
detection and correction.
PHYSICAL - This is the layer where you find cables
carrying electrical or optical signals

Telidon
NAPLPS is an extension of the experimental Telidon system
that was used in Canada in the late 1970's and early 1980's.
For more info, look up a book called Gutenberg Two. It also
includes mosaic bitmap capabilities from early European
Teletext systems.

The Basics
NAPLPS uses the 128 7-bit ASCII codes in such a way as
to be 100% compatible with any system which transmits pure
ASCII. It adds additional functions by making use of the 128
high-ASCII codes which are used on PC's for graphics
characters. This means that NAPLPS terminal programs can't
display high-ASCII unless the high-ASCII symbols are defined
as a downloadable character set and font selection codes are
transmitted prior to use of high-ASCII. In this, it is much
like Microsoft Windows which also does not use high-ASCII

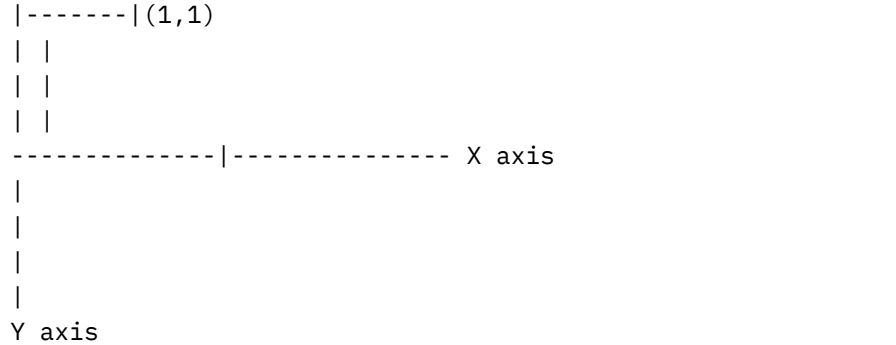
for much the same reasons.
The additional capabilities include color mapping, 24-bit color spec, line, box, circle, arc, polyline, polygon, spline curve, bitmaps, downloadable fonts, macros, input fields, line patterns, fill patterns, etc. All this is accomplished in very compact manner so that reasonably complex NAPLPS images are usually around 5 K bytes. The most complex image I have seen is 22 K bytes and contains a detailed picture of a mountain range, some trees, a horse with a native rider wearing a Hudsons Bay jacket. This spec is efficient enough to make it reasonable at 2400 bps if complex images are limited to Art Galleries. At 9600 bps and above, performance is not an issue.

ISO (International Standards Organization)
NAPLPS was designed to fit in with and be compatible with other coding schemes that are ISO standards such as 7-bit ASCII and the various Latin based alphabetical character sets. For more info, read up on MS-Windows character sets or HP Laserjet character sets as these are also designed for ISO compatibility.
There is currently a modification to the spec to include JPEG compressed bitmaps in the standard but that has not yet been approved by ANSI or ISO. I will include that info in this document as soon as I know more.

General Architecture

Character Codes
All NAPLPS info can be transmitted using either 7-bit or eight bit codes. This allows NAPLPS to be transmitted over links that require a parity bit. When 7-bit codes are used, then the extended codes are selected by shifting the extended codes into the 7-bit ASCII code table. This is similar to a keyboard shifting between upper and lower case letters. They are different symbols, but shifting (and Ctrl and Alt) allows the same key to be used.
In fact there are several different code sets that can be shifted in. The Primary code set is 7-bit ASCII. Then there is the PDI (Picture Description Instruction) set, the Supplementary set which contains accented characters and other symbols, the Mosaic set which supports the old Teletext bitmap format, the Macro set which invokes predefined macros, and the DRCS or Dynamically Redefinable Character Set which is used for non-Latin languages such as Russian, Thai, Inuktitut. When using 8-bit codes, things are simplified somewhat since two of these code tables are accessible without shifting.
Whenever the numeric value of a character code is given in this document, it will be in hexadecimal.

Coordinates
All pictures are drawn and positioned using Cartesian
(X,Y) coordinates within the Unit Screen. This is the upper
right quadrant of the Cartesian plane between (0,0) and
(1,1)



It is possible to specify 3 dimensional (X,Y,Z) coordinates
but at the current time, Z coordinates are to be ignored.
On most video displays the aspect ratio is 4:3,
therefore drawings should be restricted to a Y coordinate
between 0 and .75. Anything extending beyond either the unit
screen or the actual display screen should be clipped. So,
the physical display screen extends from (0,0) in the lower
left hand corner to (1,.75) in the upper right hand corner.
NAPLPS terminal programs must always ensure that the entire
display is visible to the user. In resizable windowing
environments (MAC, Amiga, Windows) this means that when the
display window is resized the terminal program should
maintain the 4:3 aspect ratio and scale the current image.
These coordinates are specified as binary fractions.
For instance, if 8 bits of precision are available, then the
binary number .10000000 is equal to 1/2. This is just
another way of saying that the binary number 10000000 (128
decimal) is 1/2 way between 0 and the maximum representation
in 8 bits namely 11111111 (255 decimal). If the precision is
widened to 16 bits then zeroes are added on the right so
that .1000 0000 0000 0000 still means 1/2 even though it now
represents the number 16,384 in the range of 0 to 32,768.

Stream of Data
The NAPLPS codes are a stream of data coming into the
terminal program and should be acted on in sequence. Each
graphical object is drawn on top of those already visible.
Composite pictures and alphabetic characters can be created
by superimposing multiple characters and/or images.
The specification is very flexible as far as PDI
operands is concerned. If the NAPLPS stream does not supply
the number of bits of precision that the receiving terminal
expects (less than defined DOMAIN), it simply pads the
binary fractions with zeroes on the right. This has the
effect of drawing the pictures with shorter operands using a
coarser grid. If there is more precision than the terminal

program is capable of using (defined DOMAIN is more precise than the current display), it truncates the rightmost bits of the binary fractions which has the effect of rounding the more precise drawing specs to the grid size that the display driver is capable of using.
On the other hand, if the NAPLPS stream contains more operands than would be expected with the currently defined DOMAIN, then the drawing operation is repeated in some form, i.e. lines become polylines, rectangles become bar charts, arcs become spline curves.

Code Sets

Overview
A sequence of NAPLPS codes is initiated by the 3 character sequence ESC 25 41 and is terminated by the sequence ESC 25 40. Outside of this bracketing, all NAPLPS terminal programs will support ASCII codes. Other support such as VT100 and ANSI escape sequences is out of the scope of the NAPLPS standard.
The 128 possible 7-bit codes are divided into 32 character C-sets and 96 character G-sets. The two C-sets are codes that perform control operations. C0 is the familiar ASCII set of control characters, and C1 is a set of codes that do cursor positioning, macro defining, etc.
There are two types of G-sets, 94 character and 96 character. A 94 character G-set is really just a 96 character G-set in which the codes 20 and 7F are used for <space> and <del>. The <space> code is therefore available in both the ASCII and supplementary character sets. The <del> code is treated as a null, i.e. discarded. G-sets are selected in a two stage fashion. There are 6 possible G-sets, but only 4 G-sets are current. The current G-sets are named G0, G1, G2 and G3. In the default state, G0 is the primary character set (ASCII), G1 is the PDI set, G2 has the supplementary characters, and G3 the mosaics.

Shift and Escape Codes
Five of the normal ASCII control characters are used in code sequences that shift G-sets and C-sets in and out of the active state. They are ESC (1B), SI (0F), SO (0E), SS2 (19) and SS3 (1D) or ESCAPE, SHIFT-IN, SHIFT-OUT, SINGLE-SHIFT 2 and SINGLE SHIFT 3. The single shift codes are used to temporarily escape the immediately following character. The normal control character set is always available.
The C1 set is accessed by setting the bit 8 if operating over an 8-bit link, or by ESCaping the code and setting bit 7 on a 7-bit link. For instance, DEF MACRO is 80 when eight bits are used, but it is ESC 40 when 7-bits are used. This means that on an eight-bit link, the C1 set ranges from 80 through 9F, but on a seven-bit link it ranges from 40

through 5F. There are two sequences for activating the control sets. C0 is activated by ESC 21 4B and C1 is activated by ESC 22 46. These are somewhat redundant as there are only two control sets at present.
G-sets are a bit more complex. Firstly, there are two positions in the code table that can hold a G-set, the lower 128 positions or G-left (GL) and the upper 128 positions or G-right (GR). In a 7-bit environment, GL is the only active G-set. If the 256 possible codes are arranged as 16 columns of 16 rows, then the C and G sets are laid out as follows with 2 columns (32 chars) for the C-sets and 6 columns (96 chars) for the G-sets.

```
C0 GL C1 GR
--- ----------- --- ---------
| | | | | | | | | | | | | |
```

By default GL contains G0 (ASCII) and GR contains G1 (PDI). G2 is the supplementary characters and G3 defaults to the mosaics. You can activate G0 - G3 by selecting them into the GL area as follows:
0F (SI) selects G0
0E (SO) selects G1
ESC 6E selects G2
ESC 6F selects G3
This works in both 7-bit and 8-bit mode. A single character from G2 or G3 can also be selected by using SS2 or SS3, e.g.
19 selects the 1 following char from G2
1D selects the 1 following char from G3

In 8-bit mode, you can activate GR as follows:
ESC 7E selects G1 (also ESC 6B)
ESC 7D selects G2 (also ESC 6C)
ESC 7C selects G3 (also ESC 6D)
The 6B, 6C, and 6D codes should be supported by terminal programs for backward compatibility, but should not be used in new image coding. ASCII codes cannot be selected into GR.
While the G0-G3 sets have 4 default settings, the actual G-sets in each of them can also be selected by a code sequence. For the 94 character sets (ASCII and supplementary) the code sequence is:
ESC 28 42 selects ASCII into G0
ESC 28 7C selects supplementary into G0
The code 28 could be one of:
28 represents G0
29 represents G1
2A represents G2
2B represents G3
If you are selecting one of the 96 character G-sets, use the following sequence:
ESC 2D 57 selects PDI's into G1

ESC 2D 7D selects mosaics into G1
ESC 2D 20 7A selects the macros into G1
ESC 2D 20 7B selects the DRCS into G1
The code 2D could be one of:
2D represents G1
2E represents G2
2F represents G3
If you are writing a terminal program you should also support some older code sequences for backwards compatibility. For 96 character G-sets the codes 29, 2A and 2B should be accepted as well as 2D, 2E and 2F. In addition the single byte code 7A should be accepted as equivalent to 20 7A for macros and 7B should be accepted as equivalent to 20 7B for DRCS.
If an unknown terminating code is received for a sequence, then the entire sequence should be discarded.
If a given G0, G1, G2 or G3 set is currently invoked into either GL or GR, then the new contents of that set take effect immediately. For instance, if you have invoked the default G2 (supplementary) into GL via ESC 6E and you then designate the macro set as the new contents of G2 via the sequence ESC 2E 20 7A then it is NOT necessary to re-invoke G2 by another ESC 6E.

G-Sets
The 94 symbols of the primary character set are identical to ASCII. The actual font used is implementation dependent but it must be scalable. There is no guarantee that a font is legible at all resolutions. The cursor is automatically advanced when a character from this set is displayed, according to the current TEXT settings. Note that characters that are overprinted do NOT wipe out the image of the original character as in most text mode displays. Both characters remain visible.
The 94 symbols of the supplementary character set are not ASCII and therefore must be described in this document. Again, these are scalable and the font used is implementation dependent. The codes from 21 through 3F and from 51 through 7E are displayed in the same way as ASCII, namely, the cursor is advanced after they are displayed. The codes from 41 through 4F are non-spacing accent character used to create composite characters. Normally, a composite character is formed by first displaying the non-spacing accent, and the letter. The best way to see these is to get MGE and display them at a reasonably large size to see details on some of the weird ones. They are also displayed in the standard documents and in the 1st article in the February 1983 issue of BYTE.

Supplementary Character Set
---

21 upside down exclamation as in Spanish
22 cents symbol
23 British pound symbol
24 dollar sign ASCII 24
25 Japanese yen symbol
26 number sign ASCII 23
27 subsection symbol PC code 15
28 generic currency symbol like X with o in middle
29 left single quote
2A left double quote
2B left guillemot like << PC code AE
2C left arrow like <- PC code 1B
2D up arrow PC code 18
2E right arrow like -> PC code 1A
2F down arrow PC code 19

30 degree symbol PC code F8
31 plus or minus PC code F1
32 superscript 2 PC code FD
33 superscript 3
34 times symbol like x
35 greek mu PC code E6
36 paragraph mark PC code 14
37 centered dot PC code F9
38 division PC code F6
39 right single quote
3A right double quote
3B right guillemot like >> PC code AF
3C looks like 1/4
3D looks like 1/2
3E looks like 3/4
3F upside down question mark as in Spanish

The following 16 codes are non-spacing accents
40 vector overbar (a right-pointing vector arrow
just above the top of capitals)
41 grave accent
42 acute accent
43 circumflex accent
44 tilde
45 macron or overbar
46 breve like a) laying on its side with points up
47 dot positioned over a letter
48 diaresis or umlaut
49 overprinting slash /
4A small ring or circle positioned over a letter
4B cedille as in French garcon
4C underscore
4D double acute accent
4E ogonek (mirror image of cedille)
4F caron (little v above a letter)

50 em dash
51 superscript 1
52 registered trademark R in a circle
53 copyright C in a circle
54 TM superscripted
55 musical eighth note PC code 0D
56 horizontal box drawing line PC code C4
57 vertical box drawing line PC code B3
58 / from bottom left to upper right of char field
59 \ from top left to bottom right of char field
5A filled triangle below code 58
5B filled triangle below code 59
5C looks like 1/8
5D looks like 3/8
5E looks like 5/8
5F looks like 7/8

60 greek Omega PC code EA
61 AE ligature
62 Icelandic eth D with - through the vertical
63 feminine ordinal PC code A6
64 H with horizontal stroke at 3/4 height
65 crossbar box drawing character PC code C5
66 IJ ligature
67 L with a dot centered vertically and horizontally
68 L with a short / through the vertical
69 O with a /
6A OE ligature
6B masculine ordinal PC code A7
6C Icelandic thorn like P with extended vertical
6D T with short horizontal stroke
6E Lappish capital eng looks like nj
6F looks like 'n

70 greek kappa
71 small ae ligature
72 small 62
73 mirror image of 6 with stroke
74 small 64
75 i with no dot
76 small 66
77 small 67
78 small 68
79 small 69
7A small 6A
7B German esset similar too greek beta but not same
7C small 6C
7D small 6D
7E small 6E

The PDI set

Overview
This is the heart of NAPLPS, the graphical drawing primitives. There are eight environment codes (RESET, DOMAIN, TEXT, TEXTURE, SET COLOR, WAIT, SELECT COLOR and BLINK) which set the graphics environment and 6 different object types (POINT, LINE, ARC, RECTANGLE, POLYGON, INCREMENTALS). Each type of object has 4 different forms in which it can be drawn. These codes take up the first 32 positions in the PDI set. The other 64 positions are used to encode parameters and co-ordinates for these primitives. The PDI set is not really a character set, but a set of function calls with parameters.
A PDI (Picture Description Instruction) begins with a code selecting one of the primitives. These codes can all be distinguished by the fact that bit 7 is equal to zero. This code is then followed by one or more codes containing parameter data. The PDI is terminated whenever a code that is not data is encountered, i.e. another PDI or any code outside of the PDI's G-set. The exceptions are the control codes 00 through 06, and 10 through 17 which do not affect the OSI presentation layer and are therefore ignored if encountered. Also, macro invocation does not terminate a PDI so macros can be used to provide all or some of the parameter codes. In certain cases, invalid data will require that the PDI and all data bytes up to the termination of the PDI are to be discarded with no action taken.
There are 4 types of parameters. Fixed format parameters are specific to the PDI which uses them. Bitstrings are also specific to a PDI which uses them but they are encoded in bits 6 through 1 of a string of characters. Single value operands take up from 1 to 4 bytes of data depending on the current DOMAIN setting. They are unsigned integers of 6, 12, 18, or 24 bits with the most significant bits being received first. Multi-value operands are from 1 to eight bytes of data depending on the current DOMAIN setting. These are primarily used for Cartesian coordinates but can also encode color information. The coordinates are signed integers encoded as follows:

```
X Y X Y Z
8 7|6 5 4|3 2 1| 8 7|6 5|4 3|2 1|
----------------- -----------------
|?|1|S| | |S| | | |?|1|S| |S| |S| |
----------------- -----------------
|?|1| | | | | | |?|1| | | | | | |
----------------- -----------------
. . . . . .
----------------- -----------------
|?|1| | | | | | |?|1| | | | | | |
----------------- -----------------
```

In the normal 2 dimensional case, the first byte contains the sign bit and the 2 most significant data bits. Second and subsequent bytes contain 3 data bits. Therefore these coordinates can range from 3 bit to 24 bit signed integers. These integers are fractions of the unit screen. For example, if the DOMAIN setting specified 3 bytes for multi-value operands then the unit screen would range from 0 (000 000 000) to 256 (011 111 111) units in width. Negative coordinates would be clipped as they are not on the screen. They are also used to specify relative coordinates from the current drawing point.

When a multivalue operand is used to represent a color, it is coded as follows:

```
G R B G R B
8 7|6 5 4|3 2 1|
-----------------
|?|1| | | | | | |
-----------------
|?|1| | | | | | |
-----------------
. . .
-----------------
|?|1| | | | | | |
-----------------
```

The color value is decoded by concatenating the bits for each of the Green, Red and Blue values. This color value is again treated as a binary fraction so that with DOMAIN settings for 3 bytes the range of color values would be from 0% (00 00 00) to 100% (11 11 11).

There are two special colors: nominal white is the palette entry 011...11 and has a color value of all ones; nominal black is palette entry 0 and has a color value of all zeroes. Note that this places the color white in the middle of the palette.

Whenever the required number of data bytes are not received, the receiving system should pad the data with zero bits to the correct length. This gives transmitting systems an opportunity to make transmission more efficient by not transmitting the trailing zero bits on data operands. Zero bits would look like this (1 000 000) in 7 bit form. On the other hand, if more data bytes are received than required, the receiving system should assume that the current PDI is to be repeated with a new set of data bytes unless otherwise specified for a particular PDI.

The PDI primitives are as follows:

20 RESET - selective reset
21 DOMAIN - sets graphical environment
22 TEXT - sets default text attributes
23 TEXTURE - sets line and fill patterns

24 POINT SET ABS
25 POINT SET REL
26 POINT ABS
27 POINT REL

Lines and Polylines
28 LINE ABS
29 LINE REL
2A SET & LINE ABS
2B SET & LINE REL

Arcs, Circles, Splines
2C ARC OUTLINED
2D ARC FILLED
2E SET & ARC OUTLINED
2F SET & ARC FILLED

Rectangles and histograms
30 RECT OUTLINED
31 RECT FILLED
32 SET & RECT OUTLINED
33 SET & RECT FILLED

Polygons

-------8X---cut here for part 2/6----------------
34 POLY OUTLINED - polyline
35 POLY FILLED - polgon
36 SET & POLY OUTLINED - polyline
37 SET & POLY FILLED - polygon

38 FIELD - define bitmap field or input field
39 INCREMENTAL POINT - color bitmap
3A INCREMENTAL LINE - scribble
3B INCREMENTAL POLY FILLED - filled scribble

3C SET COLOR - specify an RGB color
3D WAIT - timed pause
3E SELECT COLOR - set color mode
3F BLINK - palette animation

Default graphics environment
The following setting are the default upon starting the
program or immediately after receiving an NSR (non-selective
Reset).
- GL contains the G0 set
- in 8-bit mode, GR contains the G1 set
- G0 contains the ASCII set
- G1 contains the PDI set
- G2 contains the supplementary set
- G3 contains the mosaic set
- drawing color is nominal white
- color mode is 0
- single value operands are 1 byte
- multi-value operands are 3 bytes
- multi-value co-ordinates are 2 dimensional with Z=0
- logical pel is 0 wide and 0 high with origin
point at the lower left. This makes the logical
pel size equivalent to 1 physical pixel.
- text rotation is 0 degrees (horizontal)
- character path moves to the right
- intercharacter spacing is 1
- interrow spacing is 1
- cursor and drawing point move together
- cursor style is underscore and is invisible
- character field is 1/40 wide and 5/128 high
- line texture is solid
- no outlines are drawn on filled objects
```

- fill pattern is solid
- fill pattern mask is 1/40 wide and 5/128 high
- the active field corresponds to the unit screen
- underlining is off
- word wrap is off
- scrolling is off
- reverse video is off

The following conditions are found at startup but are NOT created by receipt of an NSR:
- palette is in default condition (see SET COLOR PDI)
1/2 evenly spaced grey scale
1/2 evenly spaced hues
- blinking is off
- no macros are defined
- no DRCS characters are defined (all <spaces>)
- no programmable fill masks are defined
- no unprotected fields are defined

RESET - 20
This PDI can selectively reset parts of the graphics environment their default values. It is followed by two fixed format bytes which specify what is to be reset. The resets are to be performed in the following order:
DOMAIN - If bit 1 of the first byte is 1, the domain parameters are reset.
COLOR - specified by bits 3 and 2 of the first byte
0 0 nothing
0 1 set color mode 0, reset to default palette and set drawing color to white
1 0 set color mode and reset to default palette. If current color mode is 0 then treat same as 1 1
1 1 set color mode 1, reset to default palette and set drawing color to white
SCREEN - specified by bits 6, 5 and 4 of the first byte
0 0 0 nothing
0 0 1 clear screen to nominal black
0 1 0 clear screen to current drawing color
0 1 1 set border to nominal black
1 0 0 set border to current drawing color
1 0 1 clear screen/border to drawing color
1 1 0 clear screen to drawing color and set border to nominal black
1 1 1 clear screen/border to nominal black
Note that most modern video displays do not allow manipulation of the border or overscan.
TEXT - If bit 1 of the second byte is 1, then the cursor is sent home to the top left of the display area and all text parameters from the TEXT PDI, the C1 set and the active field are

reset to their defaults.
BLINK - If bit 2 of the second byte is 1 then all blink
processes are terminated.
FIELDS - If bit 3 of the second byte is 1 then all
unprotected fields are changed to protected
and all field definitions except the active
field are lost. The display is not changed. If
the terminal program has any internal data
structures for editing and transmitting field
contents, they should be cleared as well.
TEXTURE - If bit 4 of the second byte is 1 then all
line texture and pattern fill attributes are
set to the default. The four programmable
pattern masks are not changed.
MACRO - If bit 5 of the second byte is 1 all macros are
cleared including transmit macros.
DRCS - If bit 6 of the second byte is 1 then all DRCS
characters are cleared by setting all DRCS
characters to be equivalent to the <space>
character.
If one or more of the data bytes are missing, then the RESET
will proceed as if it had been received with all zero bits.
If extra bytes are received, they will be discarded.

DOMAIN - 21
This command sets the precision of single and multi-
value parameter data, the number of Cartesian coordinates
and the logical pel size. The first parameter is fixed
format and that is followed by a multi-value operand to set
the logical pel size.
If bit 6 is 0, then X,Y coordinates are transmitted, if
1 then X,Y,Z coordinates are transmitted. The default
setting is X,Y. If 3-dimensional X,Y,Z is selected, then the
Z coordinates should be ignored at the present time.
The length of a multi-value operand is encoded in bits
5, 4 and 3 as follows:
0 0 0 1 byte
0 0 1 2 bytes
0 1 0 3 bytes (the default)
0 1 1 4 bytes
1 0 0 5 bytes
1 0 1 6 bytes
1 1 0 7 bytes
1 1 1 8 bytes

The length of a single value operand is encoded in bits
2 and 1 as follows
0 0 1 byte (the default)
0 1 2 bytes
1 0 3 bytes
1 1 4 bytes

The multi-value data following the fixed format byte is used to define the width and height of the logical pel which is the basic brush used in all the drawing operations. The logical pel will always be at least 1 real pixel in size, but may be larger. The width and height of the logical pel must be rounded UP to the nearest real pixel size. For instance, if the unit coordinates map to 1.3 real pixels in width, then the logical pel should be 2 pixels wide. The default size is 0,0 which makes the logical pel 1 physical pixel in both width and height. The logical pel cannot become invisible.
Unlike many graphical environments that draw pictures with a logical brush, the logical pel is NOT centered on the current drawing point. Instead the current drawing point is located as follows:

```
+,- ------- -,-
| |
| |
+,+ ------- -,+
```

For instance, if the width is .01 and the height is -.01 then the upper left corner of the logical pel is always aligned with the drawing point. To see this graphically, draw a circle in MGE with a larger pel size. Then copy it and use "Edit To" to change the copy to a smaller pel size and a contrasting color.
The data bytes defining the logical pel are interpreted according to the multi-value operand settings in the fixed format byte immediately preceding them. Any additional data bytes after the logical pel size are to be ignored. If there are no data bytes after the fixed format byte, then the logical pel size is unchanged.

TEXT - 22
This command sets up the current parameters which affect how text is displayed. This includes ASCII, supplementaries, DRCS characters and mosaics. The parameters are two fixed format bytes followed by a multi-value character field size.
Bits 6 and 5 of the first byte determine how far to move the cursor after displaying a character or after a <space>, <backspace> or <tab> character. The cursor is always moved parallel to the character path and the distance is a multiple of the height or width of the character field, depending on which one is parallel to the character path. This intercharacter spacing is defined as follows:
0 0 1 (the default)
0 1 5/4 i.e. 1.25
1 0 3/2 i.e. 1.5
1 1 proportional spacing
When the intercharacter spacing is 1, the following

character field touches the previous one, but in 5/4 and 3/2 spacing there is a gap. This would be visible in color mode 2 if the current background color contrasted with the underlying image. Proportional spacing is defined later in this document.

Bits 4 and 3 of the first byte define the character path as follows:

0 0 Right (the default)
0 1 Left
1 0 Up
1 1 Down

After a character is displayed, the cursor moves in the direction specified by the character path. This is independent of the character rotation setting.

Bits 2 and 1 of the first byte define the character field rotation as follows:

0 0 0 degrees (the default)
0 1 90 degrees
1 0 180 degrees
1 1 360 degrees

The character field rotates about it's origin which is the lower left hand corner regardless of the sign of the character field dimensions. The rotation affects all 4 character G-sets as well as the cursor and the underline produced in underline mode.

Bits 6 and 5 of the second byte define the cursor style as follows:

0 0 Underscore (the default)
0 1 Block
1 0 Cross-hair
1 1 Custom

The underscore is the full width of the character field at the bottom of the field. The block cursor fills the entire character field. The cross-hair is a vertical line and a horizontal line that intersect at the center of the character field. The custom cursor shape is implementation dependent. When the underscore and block cursors are used, the current drawing point aligns itself with the lower left hand corner. When the cross-hair and custom cursors are used, it aligns itself with the center of the character field.

Bits 4 and 3 of the second byte define how the graphical drawing point is related to the text cursor as follows:

0 0 Move together (the default)
0 1 Cursor leads
1 0 Drawing point leads
1 1 Move independently.

When the cursor and the drawing point move together, then every text character displayed causes the drawing point to

be repositioned, and every graphical drawing primitive causes the text cursor to be repositioned. The actual alignment between cursor and drawing point is determined by the cursor type. If the cursor leads, then the drawing point follows it, but it does NOT follow the drawing point. If the drawing point leads, then the cursor follows it bit it does NOT follow the cursor. Whenever the cursor is repositioned in such a way that part of the character field would fall outside the unit screen, it is automatically repositioned so that the entire character field is within the unit screen.
Bits 2 and 1 of the second byte define the interrow spacing as follows:
0 0 1 (the default)
0 1 5/4 i.e. 1.25
1 0 3/2 i.e. 1.5
1 1 2
These are interpreted as multiples of the character field height or width, whichever is perpendicular to the character path. Whenever <linefeed> or <vertical tab> is executed, the new line position is calculated according to this spacing. Note that the default single spacing causes the character fields of the two rows to meet exactly, whereas 5/4, 3/2 and double spacing leave a gap. Whenever a text character is displayed, if the subsequent cursor movement would cause part of the character field to be outside the unit screen or outside the active field, then an automatic <carriage return> <linefeed> is executed. If, by chance, a <carriage return> <linefeed> is received right after that, then it is ignored so that only one line positioning takes place.
The character field dimensions are defined by the multivalue operands following the two fixed format bytes. If the width of the character field is negative, then the characters are mirrored around the vertical center axis of the character field. If the height is negative, then they are mirrored around the horizontal center axis of the character field. If no data bytes are received, then the character field dimensions are not changed. The default width of the character field is 1/40 of the unit screen and the default height is 5/128 of the unit screen. This is like saying that by default, the unit screen is 40 chars by 25 lines (although only 3/4 of the lines are visible, i.e. 19 lines).

TEXTURE - 23
This command sets the line textures, fill patterns and the outlining of filled areas. It is a fixed format byte followed by a multi-value operand.
Bits 6, 5 and 4 define the fill pattern as follows:
0 0 0 Solid (the default)
0 0 1 Vertical hatching

0 1 0 Horizontal hatching
0 1 1 Vertical and horizontal cross-hatching
1 0 0 programmable mask A
1 0 1 programmable mask B
1 1 0 programmable mask C
1 1 1 programmable mask D
The hatching lines are one logical pel wide (or high) and are spaced one logical pel apart. The hatching patterns should maintain registration from one object to the next if the pel size for those objects is the same. Even when the logical pel size is (0,0), the solid fill is still drawn. The programmable fill masks are defined with the DEF TEXTURE command. By default, they cause no fill in color modes 0 and 1, and a background color fill in color mode 2.
Bit 3 defines whether or not to draw the outline of filled objects. If it is 1 then filled objects are outlined with a solid line (independent of the line texture) using the current pel size. In color modes 0 and 1, the outline is black; in color mode 2, the background color is used. The default is 0 for no outline.
Bits 2 and 1 define the line texture as follows:
0 0 Solid (the default)
0 1 Dotted
1 0 Dashed
1 1 Dot-Dash
This sets the texture of lines drawn by the LINE, ARC, RECTANGLE, POLYGON, and INCREMENTAL LINE PDI's. The size of a dot and the gap size is equal to the logical pel size. In horizontal lines the dashes are 3 logical pels wide, in vertical lines they are 3 logical pels high. In angled lines the visual effect of dots and dashes should be consistent with that of the specified horizontal and vertical lines. All end points of lines and arcs and all vertices should be drawn regardless of the line texture. When the pel width is 0, all non-vertical lines are solid. When the pel height is 0, all non-horizontal lines are solid.
The multi-value operand following the fixed format byte defines the mask size used in pattern fills for the programmable masks A, B, C and D. The pattern is scaled to the mask size, then tiled over the object with reference to the screen origin to maintain registration. In color mode 2 both the foreground and background colors are used to draw the pattern fill. The default mask size is 1/40 wide and 5/128 high. Negative mask sizes mirror the pattern the same way text characters are mirrored. If there is no multi-value operand, then the mask size is unchanged.

SET COLOR - 3C
This command is used to modify the color palette and is subject to the color mode set by SELECT COLOR. In color mode

0, drawing colors are explicitly specified as RGB triples and the palette is modified implicitly. In color modes 1 and 2, the color is specified as a palette entry. For example, when displaying text in color mode 0, the drawing color is specified directly and only affects the foreground pixels in the text character. In color mode 1, the color is selected from the palette and also is used to draw only the foreground pixels. In color mode 2, both foreground and background colors are chosen from the palette and both foreground and background pixels are drawn in the appropriate colors.

In order to use a color in modes 1 and 2, you must first specify the color to be placed in the palette using SET COLOR, and then you must select the palette entry to use with SELECT COLOR. Any changes to the palette are immediately reflected on the display. When a color is specified directly in mode 0, the palette is checked. If the color is already there, then the drawing color is set to the lowest palette entry with that same color. If it is not already there, mode 0 looks for the lowest palette entry that has not been used by SET COLOR or SELECT COLOR since the last RESET that has reset the palette. The palette entries for nominal black and nominal white are not used. Once an unused entry is found, it is defined and the drawing color is set to use that palette entry. If there are no available palette entries, then the drawing color is set in an implementation dependent manner.

In mode 0 the multi-value operand specifies the actual RGB color value where bits 6 through 1 of each data byte represent GRBGRB. For instance, to set the value of the green portion concatenate bits 6 and 3 from each byte as follows 6363..., for Red use bits 5 and 2 5252... and for blue use bits 4 and 1 4141... The drawing color is in effect until another SET COLOR command changes it or it is reset by a RESET or NSR. The default drawing color is white.

In modes 1 and 2, the SET COLOR command puts colors into the palette. The palette entry used is the one which is the current drawing color. It can be changed by using SELECT COLOR. Whenever the data bytes specify more bits than the palette can handle, the least significant bits are discarded. If the palette entry can handle more bits than the data bytes provide, then trailing zero bytes are added. If there are additional data bytes after the multi-value operand size, then an implicit SET COLOR command is assumed with a new palette entry. The new palette entry is determined as follows:

Take the palette entry number, change the most significant zero to a one, then change all ones to the left of it to zeroes. For example, 010100 would be incremented to 110100 which would be

incremented to 001100. This palette entry
determination does not affect the current drawing
color. The incrementing stops when a palette entry
of all ones is reached. This algorithm allows an
image to be viewed on a device with more palette
entries than are specified in the image. Carefully
placing similar colors in adjacent palette entries
will also allow the image to be viewed reasonably
on a device with fewer palette entries than the
original image.
If there are no multi-value data bytes, then the transparent
color is used. If transparency is not implemented, then the
transparent color is shown as black.
The default palette is determined by the following
algorithm:
N = number of bits in a palette entry number
i.e. 4 bits for 16 color VGA, 8 bits for 256 color
2 ^ n = the number of palette entries, i.e. 2^4 = 16
M = number of bits in the colour values, e.g. 24 bit
M >= 3 * (N - 1) This is a required relationship

The first half of the palette stores a uniformly spaced
greyscale where R = G = B. If M = 3 * (N - 1) then
there should be exactly (2^N)/2 grey levels including
black and white.
The second half of the palette stores a full rang of
hues spaced equally around the perimeter of the hue
circle with Blue at 0 degrees, Red at 120 degrees and
Green at 240 degrees. The algorithm for mixing colors
to obtain a desired hue is:
h = desired hue
ang(h) = the angle of h
P1 = the closest primary to h
ang (P1) = the angle of P1
P2 = the second closest primary to h
ang(P2) = the angle of P2
P3 = the farthest primary from h
Then the color values to give h will be:
P1 = 100% (all one bits)
P2 = |ang(h) - ang(P1)|
----
60 degrees
P3 = 0%

WAIT - 3D
This command produces a timed pause. If the terminal
program has not yet finished displaying previously received
PDI's, then the pause interval is not started until the
drawing is completed. The byte following the WAIT PDI is a
fixed format byte containing 1011100 in bits 7 through 1. If
any other byte follows the WAIT PDI, then the entire

sequence is discarded.
The 3rd and subsequent bytes specify wait intervals in bytes 6 through 1. There can be any number of wait intervals specified to add up to the required pause time. A wait interval of zero is anywhere between 0 and .1 seconds long.

SELECT COLOR - 3E
This command sets the color mode. For modes 1 and 2 it selects the palette entry to use for the foreground or drawing color. For mode 2 it also sets the palette entry for the background color. It can have 0, 1 or 2 single value operands. Any additional data bytes are discarded.
If there are no data bytes, then color mode 0 is set.
If there are data bytes for 1 single value operand, mode 1 is set and if there are data bytes for 2 single value operands, mode 2 is set. The most significant bits of the single value operands are used to determine the palette entry to use. If the single value operand has less bits than palette entry numbers, then trailing 0 bits are added.
The first single value specifies the drawing color. The second single value (if available) specifies the background color. If both operands specify the same palette entry, then the drawing color is NOT changed, only the background color. The background color is used to fill the character field in which characters are displayed. It also draws the outlines of filled objects, the spaces in line textures and the backgrounds in all pattern fills.

BLINK - 3F
This command is used to set up palette animation by creating a blink process. This process runs on a 1/10th of a second timer and periodically modifies palette entries. The palette entry to be changed is the blink-from color and the new contents of the blink-from color come from the palette entry specified by the blink-to color. The time interval that each of the two colors is visible is definable. The ON interval is when the blink-to color is visible and the OFF interval is when the blink-from color is visible.
A starting delay can be specified to synchronize multiple blink processes. The starting delay is ignored if there are currently no blink processes active. The delay is relative to the beginning of the ON interval of the most recently defined blink process. A start delay of 0 causes the ON interval of the new blink process to start at the same time as the ON interval of the previously defined blink process.
When the ON or OFF intervals, for more than one blink process, end simultaneously, they are processed starting with the first defined blink process. This means that the second and subsequent blink processes use the color map

2661. NAPLPS online graphics technical specs 3/6

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-05 06:33:58 UTC
From: mpdillon@halcyon.com
Message-ID: <1s7n4m$llk@nwfocus.wa.com>
Source record: 38713
Cross-posted to: comp.bbs.misc,comp.mail.mime,comp.multimedia,comp.os.msdos.pcgeos,comp.std.misc,comp.sys.amiga.programmer,comp.sys.atari.st.tech,comp.sys.mac.programmer,k12.ed.art,k12.comp.ed.literacy

---------8X---cut here for part 3/6------------------
resulting from the first blink process. Some complex side
effects can be created this way.
The first set of data bytes following BLINK are a
single value operand defining the blink-to color as a
palette entry. The same rules apply as for SELECT COLOR. The
blink-from color is defined to be the current drawing color
and therefore is not explicitly included in the BLINK PDI.
Following the single value operand are 3 fixed format
bytes defining the ON interval, OFF interval and START DELAY
for the blink processes. Each interval is defined in 10ths
of a second and, of course, only bits 6 through 1 are used.
This means the minimum interval is .1 seconds and the
maximum interval is 6.3 seconds. If the START DELAY is not
transmitted then it is assumed to be 0. A start delay is
ignored if there are no currently active blink processes. If
either the ON interval or the OFF interval are zero, then
any currently active blink process for the specified blink-
from and blink-to colors is terminated. There can be only
one blink process at a time for a given pair of colors. If a
blink PDI is issued with no data bytes following it then all
blink processes using the current drawing color as the blink-
from color will be terminated. When all blink processes for
a given blink-from color are terminated, then the original
blink-from color will be restored.
If there are additional data bytes after the start
delay byte, then another blink command is started
implicitly. This new blink command will automatically
increment the palette entry number to use as the blink-from
color using the same algorithm as SET COLOR uses for
incrementing palette indexes. This incrementing does not
affect the drawing color.
The number of blink processes simultaneously active is
implementation dependent but should be at least 16.

POINT SET ABS - 24
This PDI sets the current drawing point to the
coordinates specified in last one of the following multi-
value operands. No point is drawn.

POINT SET REL - 25
This PDI sets the drawing point to the current drawing
point plus the displacement specified in the following multi-

value operand. This operation may be repeated for multiple multi-value operands. No point is drawn.

POINT ABS - 26
This PDI sets the drawing point to the coordinates specified in the following multi-value operand and draws a logical pel at that point in the current drawing color. Multiple points may be specified by transmitting more coordinate pairs.

POINT REL - 27
This PDI sets the drawing point to the current drawing point plus a displacement specified in the following multi-value operand and draws a logical pel at that point in the current drawing color. Multiple points may be specified by transmitting more X,Y displacements.

LINE ABS - 28
This PDI draws a line in the current color from the current drawing point to the end point specified in the following multi-value operand. If more than one operand is transmitted, lines will be drawn until there are no more data bytes. The current drawing point is set to the last end point. The thickness of the line is determined by the logical pel size since the logical pel is used as a brush to draw the line as in the example below.

LINE REL - 29
This PDI draws a line in the current color from the current drawing point to a point specified by the X,Y displacement in the following multi-value operand. If more than one operand is transmitted, lines will be drawn until there are no more displacements. The current drawing point is set to the last end point.

SET & LINE ABS - 2A
This PDI is similar to LINE ABS except that the first multivalue operand after the PDI is used to set the current drawing point before drawing commences.

SET & LINE REL - 2B
This PDI is similar to LINE REL except that the first multivalue operand after the PDI is used to set the current drawing point before drawing commences.

Arc Drawing
The ARC PDI's are used to draw circles, circle segments and curvilinear splines. Arcs are drawn from a start point, through an intermediate point to an end point. The start and end points are the same point, then the intermediate point defines the diameter of a circle and a circle is drawn. If more than 3 points are specified, then a curvilinear spline is drawn. The minimal acceptable implementation according to the standard is a straight line connecting all the end points, but in this day and age a B-spline should be used. B-splines are used in TrueType font outlines and can readily be drawn using CAD programs, so B-spline support would be useful for converting display typefaces and CAD drawings to NAPLPS format. The maximum number of points in a spline is implementation dependent but should be at least 256.
If the 3 points specified for an arc are collinear, then a line is drawn from the start point to the end point. If the end point is omitted, it is assumed to be the same as the start point and a circle is drawn. After drawing the arc, the current drawing point is set to the end point.
If an arc is filled, then the area between the arc and the chord specified by the start and end points is filled with the current colors and current fill pattern. The line width of the chord is affected by the logical pel size, but if the arc is outlined, the chord is NOT outlined.
There is a good reason why the chord is filled rather that the pie segment and why only the circular portion of the arc is outlined and not the chord. Firstly, a pie segment is easily composed of a filled arc and a triangle which have the chord line in common. It is possible to construct curved objects more efficiently by drawing several end-to-end filled arcs and an interior polygon which connects the chords of those arcs (see cloud in the BYTE sample). If this object is to be outlined, you would not want the chord lines to be visible but you would want the curved portions to be visible. The alternative is to draw a polygon with many short line segments to approximate the curves but that takes many more bytes and is less efficient. Remember, most of the world still runs on 2400 bps modems. Well designed NAPLPS images can be transmitted quite reasonably at that speed.

ARC OUTLINED - 2C
This PDI draws an unfilled arc in the current drawing color. The start point is the current drawing point. Only the intermediate and end points are specified in the following multi-value operands.

ARC FILLED - 2D
This PDI is the same as ARC OUTLINED except that the start and end points are joined by a chord in the current drawing color and the arc is filled with the current color

and fill pattern. If the TEXTURE settings specified that outlines should be drawn, only the curved part of the arc is drawn in the background color.

SET & ARC OUTLINED - 2E
This PDI is the same as ARC OUTLINED except that the first multi-value operand sets the current drawing point.

SET & ARC FILLED - 2F
This PDI is the same as ARC FILLED except that the first multi-value operand sets the current drawing point.

Rectangle Drawing
The rectangle commands draw rectangles of a specified width and height. After the rectangle is drawn the endpoint is displaced from the starting point by the width only. This facilitates drawing bar charts along a baseline. If additional data bytes follow a rectangle command, they are interpreted as additional width and height specifications for additional rectangles.

RECT OUTLINED - 30
This PDI draws an unfilled rectangle in the current drawing color starting at the current drawing point.

RECT FILLED - 31
This PDI draws a filled rectangle starting at the current drawing point. The fill is done with the current drawing color and fill pattern.

SET & RECT OUTLINED - 32
This PDI is the same as RECT OUTLINED except that the current drawing point is set by the first multi-value operand.

SET & RECT FILLED - 33
This PDI is the same as RECT FILLED except that the current drawing point is set by the first multi-value operand.

Polygon Drawing
The polygon command is used to draw filled and unfilled polygons. The polygon is defined as a series of displacements from a starting point. The last point in a polygon is implicitly the same as the starting point to ensure that it is closed. The drawing point is unchanged after drawing a polygon.
The number of vertices allowed in a polygon is implementation dependent but should be at least 256.

POLY OUTLINED - 34
This PDI draws a polygon starting at the current drawing point.

POLY FILLED - 35
This PDI draws a filled polygon starting at the current drawing point.

SET & POLY OUTLINED - 36
This PDI is the same as POLY OUTLINED except that it sets the current drawing point first.

SET & POLY FILLED- 37
This PDI is the same as POLY FILLED except that it sets the current drawing point first.

FIELD - 38
This PDI defines the active field position and dimensions. The active field is used for displaying and scrolling columnar or wordwrapped text, for setting up unprotected input fields and for displaying bitmapped images. If there is already an active field, it will be replaced by this new active field.
The first parameter after the PDI is the origin of the field in absolute coordinates. The second multi-value operand, gives the width and height of the field. If the width or height are negative, then the origin point of the field will not be in the lower left corner. This is handled the same way as the logical pel size under the DOMAIN PDI. The current drawing point is set to the field origin point. If there are no multivalue operands after the FIELD PDI, then the active field is set to the default setting of the full unit screen with the origin at (0,0). If there is only one multi-value operand, then it is used as the field dimensions and the current drawing point will be used as the origin point.

INCREMENTAL POINT - 39
This PDI displays a color bitmap within the active field. Each pixel specified in the bitmap is drawn by one logical pel using the color specified in the bitmap. In color mode 0, the colors are explicitly specified as RGB values. In modes 1 and 2, they are palette entries. The color settings or selections caused by the incremental point command have exactly the same effect on the graphics environment as a SET COLOR (mode 0) or SELECT COLOR (mode 1 & 2) command including side effects dealing with palette entries.
The active field is important as it bounds the bitmap and determines the number of pixels or pels per line in the bitmap. Pels are displayed starting at the current drawing point. After drawing the pel, the drawing point is displaced in the X direction by an amount equal to the width of the logical pel. Positive widths move right, and negative ones move left. At this point, if the new position of the logical pel causes it to overlap the active field boundaries, then

two things happen. First, any remaining bits in the current data byte are discarded. Then, if there are any more data bytes, the drawing point is repositioned at the boundary opposite the overlapping one (like a carriage return). If it is possible to displace the logical pel in the Y direction without overlapping the field boundary, then this is done, otherwise, the Y position is unchanged but the entire field contents are scrolled in the opposite direction. Positive pel heights move up but scroll down, negative heights reverse the directions. After the repositioning is completed, the next pel is drawn.

Once the last pel has been drawn, the current drawing point is set back to the field origin.

The first byte following the INCREMENTAL POINT PDI is a fixed format parameter that describes the number of bits per pixel that are used to specify the pixel color or the palette entry. This number ranges from 1 to 48. If it is 0 or if it is greater than 48, then the entire PDI is discarded. The following data bytes are a bitstring consisting of bits 6 through 1 of each data byte. In color mode 0 the number of bits equal to the packing count are arranged GRBGRBG...BGRB. These are to be extracted and interpreted as RGB colors in the same way as the multi-value color operands used by SET COLOR. Note that if the packing count is not a multiple of 3, then there will not be the same number of bits for each of the three primary colors. For instance, with a packing count of 5, the bit string would be GRBGRGRBGRGRBGR...

^ ^ note that Blue is not specified

In modes 1 and 2, the bitstring consists of palette indexes concatenated together.

In some cases it will be necessary to rescale either the logical pel dimensions and the active field dimensions in order to ensure that both of them are integer multiples or integer fractions of the physical pixel dimensions. If this scaling is done, then the original unscaled values for both the active field and the logical pel are restored after the INCREMENTAL POINT PDI has completed. This scaling must ensure that the resulting bitmap image is guaranteed to lie within the ORIGINAL active field and that skewing of the image does not occur. This means that the new dimensions must display the same number of pels per line as the original ones. It also means that the rescaled bitmap will be smaller than the actual specified field size.

If any portion of the logical pel for the initial drawing point lies outside the active field, then the entire PDI is discarded. If either width or height of the current logical pel is equal to zero, then for the duration of the INCREMENTAL POINT PDI, it is set to the smallest value possible within the current DOMAIN.

INCREMENTAL LINE - 3A
This PDI defines a scribble which is an efficient
representation for certain types of polylines such as a
signature. The line segments in the scribble are drawn with
the current color and line texture.
The first operand is a multi-value operand which
specifies the step-size as separate x and y displacements
referred to as dx and dy. Following this, the data bytes
define a bitstring consisting of a series of 2 bit opcodes
as follows:
00 makes the following opcode one of:
00 toggle the draw flag
01 reverse the sign of dx
10 reverse the sign of dy
11 reverse the sign of dx and dy
01 move the drawing point dx in the x direction
10 move the drawing point dy in the y direction
11 move the drawing point dx in the x direction
and dy in the y direction
If the draw flag is on, each of the move instructions causes
a line segment to be drawn from the current point to the new
point. When the INCREMENTAL LINE starts, the draw flag is on
unless it is turned off explicitly. The current drawing
point is set to the last point in the scribble.

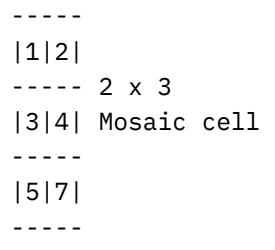
INCREMENTAL POLY FILLED - 3B
This PDI is almost identical to the INCREMENTAL LINE,
except as follows:
1. The scribble is filled with the current colors and
fill pattern.
2. the draw flag is always on
3. If an opcode to turn off the draw flag is
encountered, it is skipped.
4. The final drawing point is implicitly the same
as the starting point to ensure closure.
5. the maximum number of nodes allowed is the same
as for the polygon PDI's.

The Mosaic set

Overview
This G-set consists of 65 2x3 block mosaic characters
and 31 <space> characters. The mosaic range from 20 to 3F
and from 60 to 7F and a special one at 5F. The bit pattern
of the character code determines the bit pattern of the
mosaic character:

7 6 5 4 3 2 1

| |1| | | | | data byte



One bits in the data byte cause the corresponding mosaic cell to be visible. If you want to see what they look like, use MGE or get a copy of the official standards document or look in the February 1983 issue of BYTE magazine.
Mosaic characters are normally displayed in contiguous mode so as to create the effect of a monochrome bitmap. However, when text underline mode is on, they are displayed as separated with no actual underscore. In contiguous mode, the mosaic cell size is determined by dividing the character field into six equal rectangles. In separated mode, the character field size is reduced in width by the width of a logical pel and reduced in height by the height of a logical pel before subdividing into six equal rectangular parts. The scaled down mosaic characters are left and bottom justified within the character field. If either dimension of the logical pel is greater than the corresponding character field dimension, then the mosaics are invisible in separated mode.
Mosaic code 20 is not subject to underlining and mosaics are never proportionally spaced. The mosaic displayed by code 5F is the same as 7F

The Macro Set

Overview
This set contains 96 codes which can be used to define and invoke macro. A macro is simply a stream of NAPLPS bytes that are captured by the terminal program and assigned to a code in the macro set. They may be buffered in RAM or on disk as desired by the implementor. Once the macro is defined, it can be recalled by invoking the macro set and transmitting the single byte code for the macro. Macros can also be recalled within the definition of another macro, so it is necessary for the terminal program to beware of infinite macro loops.
There are three control codes which define a macro (DEF MACRO, DEFP MACRO, and DEFT MACRO). Any of these macros may be linked to a user input such as a function key or mouse click so that it may be activated or transmitted by the user.
Macro expansion can occur in odd places, such as in the middle of a PDI's data bytes, so be careful.

Dynamically Redefinable Character Set

Overview
This G-set is a character set that may be defined and redefined by the host system transmitting the NAPLPS codes. This could be used simply for a different looking font, or it could be used to enable use of NAPLPS with a non-Latin based language such as Russian, Thai or Inuktitut. The 96 codes in the DRCS are treated as <space> until they are explicitly defined by a DEF DRCS control command. When these codes are displayed they are subject to the same features and limitations as alphanumeric text.

Character Field Layout
When defining characters for a DRCS, one should take certain factors into consideration when planning the character field layout. Remember, that the entire character shape must lie 100% within the character field including descenders and accents. The characters should be designed with a baseline that is offset far enough from the bottom of the character field to leave room for descenders and the underline which is drawn at the bottom of the character field. Approximately 20% of the character field height is a good starting point. Similarly, the maximum character height should be offset below the top of the character field to leave enough room for accents to be placed on the characters. Approximately 10% of the character field height is a good starting point. In addition, a small allowance should be made on the left and right of the character field to provide an intercharacter spacing. If it is not possible to leave space on both sides, then put the space on the right of the character. Of course, there may be times when some or all of these rules may be broken, but they should be understood first, and then only broken for a reason.

C-Sets

C0 Control Set
These are the normal ASCII control characters. Note that this specification defines what happens when the codes are received in the NAPLPS data stream. This is not necessarily the same behavior as when these codes are received from the keyboard, and in fact, it is up to the implementor to decide how to handle keystrokes. Keystrokes are not part of the NAPLPS spec.
Any specifications that deal with what to do with the character field and cursor position and the active field, when the active field boundaries are crossed, only take place if the character field in it's original position is wholly within the active field. If it is not wholly within the active field, then the same processing takes place, but with reference to the entire display area.

Backspace - 08
This code moves the cursor a parallel to the character path but in a direction opposite from the normal character advance and by a displacement equal to the normal character advance. If the new cursor position is wholly or partially outside of the active field or the display area, then the cursor is moved to the opposite edge of the field and a <vertical tab> is executed.

Tab - 09
This moves the cursor in an opposite direction but in a similar manner to <backspace>.

Line Feed - 0A
This moves the cursor perpendicular to the character path and by a displacement equal to the interrow spacing. If the new character field position is wholly or partially outside of the active field, then one of two things happens. If scroll mode is active, the character field stays at its old position and the active field is scrolled in a direction opposite to the intended cursor movement. If scroll mode is off, then the character field is positioned at the opposite boundary of the active field.

Cursor Position - 1C
The two bytes following this control code represent a row and column address to which the cursor is positioned. The row address is decoded by taking bits 7 through 1 of the first byte and subtracting 32. The column address is obtained from the second byte in the same way. This gives a range from 0 through 95 inclusive. If either of the 2 bytes following the 1C is from the C0 or C1 sets, then the entire sequence is discarded. NOTE that row 0, column 0 is in the lower left corner of the display screen (Cartesian coordinates).

Vertical Tab - 0B
This moves the cursor in an opposite direction but in a similar manner to <linefeed>.

Clear Screen - 0C
This moves the cursor to the upper left character position on the display and clears the screen. In color

```
---------8X---cut here for part 4/6------------------
modes 0 and 1, the screen is cleared to nominal black, in
mode 2 it is cleared to the background color.

Carriage Return - 0D
This moves the to the first character position in the
active field that is on the character path.

Home - 1E
This moves the cursor to the upper left character
position on the display.

Shift-Out - 0E
This invokes the G1 set into the GL which makes it
available as ASCII codes 20 through 7F.

Shift-In - 0F
This invokes the G0 set into the GL which makes it
available as ASCII codes 20 through 7F.

Single-Shift-2 - 19
This invokes the G2 set into the GL which makes it
available as ASCII codes 20 through 7F. This shift only
affects the byte immediately following the 19 code after
which the GL is restored to its former contents.

Single-Shift-3 - 1D
This invokes the G3 set into the GL which makes it
available as ASCII codes 20 through 7F. This shift only
affects the byte immediately following the 19 code after
which the GL is restored to its former contents.

Escape - 1B
This code is used to start various escape sequences
which are documented elsewhere.

Transmission Control
The codes SOH(01), STX(02), ETX(03), EOT(04), ENQ(05),
ACK(06), DLE(10), NAK(15), SYN(16), and ETB(17) are reserved
for use at other layers of the OSI model. If they do make it
through to the presentation layer, then they are ignored and
have no effect whatsoever. In the OSI model, these codes
would be used in lower layers to implement error-free
transmission of data packets with some type of network
handshaking protocol.
```

Device Control
The codes DC1(11), DC2(12), DC3(13), and DC4(14) are
also reserved for use of other layers of the OSI model. They
are ignored if they appear in the NAPLPS data stream.

Null - 00
This code is used at other layers of the OSI model. It
is ignored if encountered in the NAPLPS data stream.

Bell - 07
This code is used to beep or make some other audible
sound which is implementation dependent.

Cancel - 18
This code is used to terminate the processing of all
currently executing macros. Execution resumes at the next
code following the terminated macro call. The CAN code is
not queued, it has an immediate effect even if there are
other NAPLPS codes in a buffer which have not yet been
processed.

Service Delimiter - 1A
This code is discarded if encountered in the NAPLPS
data stream. It is intended to act as a delimiter for the
transmission of unprotected field contents back to the host
system. The full format is as follows:
NSR - begins the transmission
DOMAIN - only required if the domain settings are
different from the default.
FIELD - marks the beginning of the field contents. The
field coordinates are used to identify the
field.
TEXT - only required if the text size is different
from the default
POINT SET - only if required to locate the first
character position in the field.
SELECT COLOR - only when the text color changes. If
mode 0, then use SET COLOR.
Character codes including code set changes to use
supplementary, mosaics, DRCS. May also include control
codes for cursor positioning and repeat codes.
END - marks the end of each field.
The sequence between FIELD and END is repeated for
each unprotected field being transmitted.
POINT SET - tell the host where the current drawing
point is.
Service Delimiter - marks the end of transmission

This facility is akin to a dialog box. The host uses
NAPLPS to draw the screen and define unprotected fields. The
host can also transmit text into the unprotected fields and
the terminal program should store that text and allow the
user to edit it. Then upon receiving some keystroke or mouse

click, the terminal program will transmit the edited contents of all unprotected fields back to the host. The only characters guaranteed to be transmitted are those in the ASCII, supplementary, mosaic and DRCS sets. This facility is modeled upon that provided by block-mode terminals.
If the terminal program allows arbitrary NAPLPS sequences to be entered into unprotected fields, then that facility can be used to implement graphical e-mail. The user uses a mouse to draw images in the unprotected field along with any text they type. The entire sequence of NAPLPS codes required to redraw the same image on another person's screen is recorded and transmitted back to the host system when the user requests the fields to be sent by pressing a key or clicking somewhere. If the user has a pen input device such as a graphics tablet, they could even create handwritten messages using the NAPLPS scribble PDI (INCREMENTAL LINE).
Unprotected fields which have NOT been changed, need not be transmitted back to the host. If no fields are changed and the transmission is initiated, then the minimum transmission consists of the NSR, DOMAIN, POINT SET, and Service Delimiter. Users can only edit unprotected fields when the text cursor is on (visible).

NSR - 1F
Non-Selective Reset is used to reset most of the environment settings to their default state as follows:
The G0, G1, G2, G3, C0 and C1 sets are reset to have their default initial contents and the GL and GR are also reset to their initial state.
The DOMAIN parameters are set to the default as specified earlier in this document.
Any text settings from the TEXT PDI or from the C1 set are reset to the default. In addition the active field is set to the default of the unit screen.
Any TEXTURE parameters are set to the default, but the programmable fill patterns are NO cleared.
The color mode is set to mode 0 and the current drawing color is set to nominal white, however the color palette is NOT cleared
If the two bytes immediately after 1F are between 40 and 7F, then the cursor is repositioned. The row number is taken from bits 6 through 1 of the first byte, the column address is from bits 6 through 1 of the second byte. Row 0, column 0 is the upper left corner of the display. The actual character position is constrained to be within the display area even if the row column address extends beyond this area.
NOTE: cursor positioning by the NSR code is NOT THE SAME as cursor positioning via the CURSOR POSITION code 1C.

They use a different origin, and the NSR positioning takes place AFTER the text parameters are reset to the default. Because of this it is usually NOT POSSIBLE for NSR character positioning to register properly with that of code 1C.

C1 Control Set
These are additional control codes which are used for NAPLPS specific operations. There is a bit of complexity involving the use of the C1 set in 7-bit mode. Because of the need to ensure that the normal ASCII control characters are still available (some are used outside of NAPLPS), it is not possible to replace the C0 set with the C1 set. Therefore, in 7 bit mode, the C1 set is placed in the middle of the GL area from 40 through 5F and a C1 code is invoked by preceding it with an ESC (1B) code. This means that the GL area can still be used as normal for PDI's, ASCII text or whatever, since C1 codes must be escaped. In 8 bit mode, there is no conflict as the C1 set is always available at the beginning of the upper 128 character codes from 80 through 9F. There is no shifting or escaping required in 8 bit mode.
In this section, the eight bit codes are given for the C1 set. They can be converted to 7 bit codes by swapping bits 8 and 7.

DEF MACRO - 80
This code is used to begin macro definition. The byte following the DEF MACRO must be between 20 and 7F. It is the macro number which is being defined or replaced. If the second byte is not within this range, then the two bytes are discarded and decoding begins with the next byte.
All characters after the macro number are recorded but not executed up to the macro termination. The termination is indicated by receipt of another DEF MACRO or one of DEFP MACRO, DEFT MACRO, DEF DRCS, DEF TEXTURE, or END. The terminating control character is NOT stored and neither is the preceding ESC which is transmitted on a 7-bit link.
If a macro reference is encountered during macro definition, then the reference is stored as is. It is NOT expanded at definition time. If the macro definition is null, i.e. no definition bytes before the terminator, then any existing macro with that number is deleted. All macros are deleted by the RESET PDI.
It is NOT necessary to have the macro G-set currently invoked in order to define a macro.
These macros (and DEFP macros) may be associated with a keystroke or mouse click to be initiated by the user, but if so, they are only available to be activated when the cursor is on. Because the execution of these macros could place the terminal program in an undetermined state, it is the responsibility of the host system to restore the state of

the terminal program to a known state after the cursor is turned off. The terminal program must ensure that any such macro is executed to completion without being interleaved with any incoming NAPLPS codes.

DEFP MACRO - 81
This command is the same as DEF MACRO except that the stream of characters making up the macro definition are executed as well as recorded. If a DEFP MACRO contains a reference to the macro number that is being recorded, then that reference should be treated as an undefined macro. This also applies to nested references, i.e. while defining macro 1 with the DEFP MACRO, a reference to macro 2 is encountered. Upon expanding macro 2 a reference to macro 1 is encountered. Because the definition of macro 1 is not yet complete, macro 1 is treated as an undefined macro.

DEFT MACRO - 82
This command defines a transmit macro. This is a string of bytes which is intended to be transmitted back to the host computer. The data bytes in a DEFT MACRO are not executed and are not necessarily NAPLPS data. They are only useful if the terminal program provides some means of causing the macro to be transmitted back to the host when a function key or mouse click event occurs. This is similar to defining a programmable function key except that the NAPLPS spec doesn't deal directly with the keys. It would be up to the terminal program to allow the user to associate a given macro with a given key combination. The transmit macros must always be available to the user for transmission, even when the cursor is off.
The transmit macros use the same pool of 96 macro numbers as do other macros. There is only 1 macro set. Macros linked to keystrokes should be defined starting with code 20 and macros that are not linked should be defined in reverse order starting with code 7F. The terminal program should provide at least 8 macros associated to keystrokes. In my opinion, 12 is a better number for PC's as there are 12 function keys available. In fact, the cluster of INS,DEL,HOME,END,PGUP,PGDN and the 4 arrow keys should also be associated with transmit macros.

DEF DRCS - 83
This command is used to define a DRCS character shape in a manner similar to macro definition. If the byte following DEF DRCS is between 20 and 7F it is used as the code for the DRCS character to define or redefine. If the code is not within the range then the DEF DRCS code and the incorrect code are discarded.
Next comes a stream of NAPLPS data which is used to define the shape of the DRCS character. This stream is

terminated by one of END, DEF MACRO, DEFP MACRO, DEFT MACRO, DEF TEXTURE, or another DEF DRCS. The standard states that the NAPLPS stream defining the character should be executed as it is received, but is NOT displayed on the screen. It is instead used to modify an in-memory bitmap which is used later to display the DRCS character. It should also be possible to store the NAPLPS stream as is done with macros, and execute the stream at the time the DRCS character is to be displayed. This would provide far better scalability of the characters. You could also convert the NAPLPS stream into a scalable format that is native to the graphical environment you are using. This would allow somewhat faster display when the DRCS is used. Note that you can use macros and other DRCS characters as part of the definition sequence.

All NAPLPS code received during DRCS definition will have its usual effect on the state of the terminal program, except that any drawing operations do NOT affect the display area. However, things like palette changes WILL still be visible as they are part of the global state. All these state changes will remain in effect after DRCS definition is finished.

When rendering the NAPLPS code into the in-memory bitmap, the aspect ratio of the bitmap will be the same as the character field dimensions in effect at the time the DEF DRCS was received. The lower left corner of the bitmap will correspond to the lower left corner of the unit screen. The larger of the X and Y dimensions of the bitmap will be considered to be equal to 1 unit (the full extent of the unit screen in that dimension). Any changes to the character field dimensions within a DRCS definition will not affect this sizing but will effect the next DEF DRCS command. The in-memory bitmap is a monochrome bitmap that is initially all black. All drawing commands will be drawn in white on the bitmap unless they are drawn with a nominal black color. The actual resolution of this bitmap is implementation independent. Although the standard does not suggest this, I would think that on today's computer equipment, this rendering should be delayed until the DRCS characters are actually used, at which point the bitmap size should be equal to the current character field size, and bitmap characters should be cached for reuse.

Once the DRCS definition is completed, the unit screen once again corresponds to the physical screen and the current drawing point is set to (0,0).

If the DRCS definition is terminated by another DEF DRCS command, then the character code to be defined is NOT transmitted. It is calculated by incrementing the previous character code and wrapping around so that 7F increments to 20. If a DEF DRCS command is terminated with no character

definition, then the character definition for that code is reset to the default <space> character. The entire DRCS can be cleared with the RESET PDI.
When a DRCS character is displayed, the rendered bitmap is scaled to the current character filed dimensions and the white portions of the bitmap are to be displayed in the current drawing color. In color mode 2, the black portions of the bitmap will also be displayed but in the current background color. DRCS characters are subject to all the attributes of text just as the ASCII set and supplementary set.
I have gone a little further than the standard in suggesting that the scaled bitmap method of displaying DRCS characters is really not appropriate on today's computer equipment. Since the ordinary text character shapes for the ASCII and supplementary sets are not specified, most systems will provide fully scalable fonts for those characters. If the DRCS characters are not also handled in an equivalent scalable manner, then they will not look very good.

DEF TEXTURE - 84
This defines or redefines one of the four programmable pattern fills. The pattern mask A, B, C, or D is selected by the byte following the DEF TEXTURE which must be one of 41, 42, 43 or 44. If the code is not one of these four, then the 2 bytes are discarded.
Next comes a stream of NAPLPS data which defines the pattern mask in the same way as the DEF DRCS except that the mask size defined in the TEXTURE PDI is used instead of the character field size. The command is terminated by END, DEF MACRO, DEFP MACRO, DEFT MACRO, DEF DRCS, or another DEF TEXTURE.
If the INCREMENTAL POINT command is used in defining the pattern, then be aware that the active field may be rescaled as specified under the INCREMENTAL POINT PDI. This rescaling will cause the actual area drawn by INCREMENTAL POINT to be smaller than that specified.
If there is no data after the mask number, then the specified mask is reset to its default state. At the end of the DEF TEXTURE command, the unit screen is set back to the physical display and the current drawing point is set back to (0,0).
While the standard assumes that these pattern masks will be stored as bitmaps and scaled as needed, I think it would be useful to record them in the same scalealble manner as I have suggested for the DRCS characters.

END - 85
This command terminates a DEF MACRO, DEFP MACRO, DEFT MACRO, DEF DRCS or DEF TEXTURE. It is also used in transmitting protected field data back to the host system.

UNPROTECT - 9F
This command turns the current active field into an unprotected field. This makes the field area available for the user to enter and edit data for transmission back to the host system. The actual methods/keystrokes for entering and editing data is implementation dependent. The default state of the unit screen is protected, so no entry of data may occur until an UNPROTECT is issued. If the UNPROTECT command is received when the active field overlaps an already unprotected field, then the unprotected field is changed to protected before the active field is unprotected. This ensures that unprotected fields never overlap. Changes in the protection status do not affect the visible display. The number of unprotected fields that may be defined is implementation dependent but should be at least 40.
If the host transmits data into an unprotected field that data will be recorded by the terminal program and will be made available for the user to edit. Editing can only take place if the unprotected field is also the active field. The user can transmit the edited data back to the host system by an implementation dependent keystroke or mouse click. Details of the transmission format are defined under "Service Delimiter" in the C0 set. When more than one unprotected field is transmitted, they are transmitted from left to right, top to bottom, using the field origin coordinates to determine which is leftmost or topmost. The transmission of data is to be handled independently of the receiving of data, including any state changes made by the user to text colors, character set, etc.
It is allowed to have other methods of user input that are independent of the unprotected fields and that do not affect the state of unprotected fields.

PROTECT - 90
This command causes any unprotected fields that overlap the active field to be changed to a protected state. The RESET PDI can be used to protect all unprotected fields.

REPEAT - 86
This command gets a repeat count from bits 6 through 1 of the byte following the REPEAT code and repeats the byte preceding the REPEAT code, by that number of times. This code can only be used to repeat <space> characters and any spacing characters from the ASCII, supplementary, DRCS or mosaic sets. This means that the non-spacing accents in the supplementary set cannot be repeated. If the preceding character is not one of those allowed, then the REPEAT code and the count byte are discarded. If bits 7 through 1 of the repeat count fall outside the range from 40 through 7F, then the REPEAT code is discarded and the count byte is interpreted as a normal NAPLPS code.

REPEAT TO EOL - 87
This command repeats the preceding byte as many times as is required to reach the end of the current character path if it is one of the allowed characters as for REPEAT. Otherwise, the REPEAT TO EOL is discarded. If the character field position lies wholly within the active field when this command is received, then the character path will be considered to end when it reaches (but does not pass) the active field boundary.

REVERSE VIDEO - 88
This causes any following text from the ASCII, supplementary, DRCS and mosaic sets to be drawn reversed. In color modes 0 and 1, the pixels of the character shape are not draw, only the background pixels are drawn using the current drawing color. In color mode 2, the foreground and background colors used are swapped. This will require special handling to ensure that composite characters are displayed correctly. Composite characters are composed of a non-spacing accent followed by another character from the ASCII set. The composite character codes must always be transmitted in that order, accent first, then ASCII character.

NORMAL VIDEO - 89
This terminates reverse video mode and returns to the default.

Text Sizes
Text sizes can be set by the following commands or by the TEXT PDI. The following commands effect only the character field dimensions. All other text attributes remain constant. The screen sizes quoted assume the default rotation and character path is in effect.

SMALL TEXT - 8A
This sets the dimensions of the character field to 1/80 in the X dimension and 5/128 in the Y dimension. This corresponds to an 80 by 19 screen when accounting for the fact that only 3/4 of the Y dimension is visible.

MEDIUM TEXT - 8B
This sets the dimensions of the character field to 1/32 in the X dimension and 3/64 in the Y dimension. This corresponds to a 32 by 15 screen when accounting for the fact that only 3/4 of the Y dimension is visible.

NORMAL TEXT - 8C
This sets the dimensions of the character field to 1/40 in the X dimension and 5/128 in the Y dimension. This corresponds to a 40 by 19 screen when accounting for the fact that only 3/4 of the Y dimension is visible.

DOUBLE HEIGHT - 8D
This sets the dimensions of the character field to 1/40 in the X dimension and 5/64 in the Y dimension. This corresponds to a 40 by 9 screen when accounting for the fact that only 3/4 of the Y dimension is visible.

DOUBLE SIZE - 8F
This sets the dimensions of the character field to 1/20 in the X dimension and 5/64 in the Y dimension. This corresponds to a 20 by 9 screen when accounting for the fact that only 3/4 of the Y dimension is visible.

WORD WRAP ON - 95
Any text received after this code is word wrapped when the line reaches the end of the character path. If the text is being displayed in the active field, then word wrapping takes place when the character path meets the active field boundary. If a <space> character is the last character on the line and the <space> character does not fit, then it is simply discarded. A word is defined as a string of characters between <space> characters. If one of the following list of special characters is embedded within the word (i.e. not at the beginning or end) then the word may be broken AFTER the special character in order to fill the line as much as possible.
! " $ % ( ) [ ] < > { } ^ * + - / , . : ; = ? _ ~

A word is also terminated when a mosaic character is encountered or when any C set character (except SI, SO, SS2 , SS3) is encountered. If the word fills the line with no spaces or special characters, then it is broken at the end of the line anyway.

WORD WRAP OFF - 96
This turns off word wrap and text now breaks between characters. This is the default.

SCROLL ON - 97
This turns on scroll mode. In this mode any <linefeed> or <vertical tab> that would otherwise cause the character field to move partially or wholly outside the display area, triggers scrolling. The display scrolls in a direction

2663. NAPLPS online graphics technical specs 5/6

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-05 06:36:31 UTC
From: mpdillon@halcyon.com
Message-ID: <1s7n9f$lmn@nwfocus.wa.com>
Source record: 38716
Cross-posted to: comp.bbs.misc,comp.mail.mime,comp.multimedia,comp.os.msdos.pcgeos,comp.std.misc,comp.sys.amiga.programmer,comp.sys.atari.st.tech,comp.sys.mac.programmer,k12.ed.art,k12.comp.ed.literacy

```
---------8X---cut here for part 5/6------------------
opposite to the direction of the <linefeed> or <vertical
tab> and only scrolls far enough so that the current
position of the character field is now wholly within the
display area. If the cursor movement command takes place
within the active field, then only the area within the
active field is scrolled. The blank area that scrolls into
view is nominal black in color modes 0 and 1, or the
background color in color mode 2.
Any buffering of data that is scrolled off the display
is implementation dependent.

SCROLL OFF - 98
This command turns off scrolling mode. If the text
cursor is advanced beyond the bounds of the display area (or
active field) by a <linefeed> or <vertical tab> then it
simply wraps to the opposite boundary.

UNDERLINE START - 99
` This command turns on underline mode. In this mode all
ASCII, supplementary, and DRCS characters and any <space>
character are displayed with a line. This line is drawn from
the character field origin across the entire width of the
character field but it does not go across the gaps created
by 5/4 and 3/2 character spacing. Its thickness is the
height of the logical pel. Mosaic characters are not
underlined, but are instead displayed in separated mode as
defined under the section "The Mosaic Set".
The underscore is then rotated along with the rest of
the character field if a rotation is specified.

UNDERLINE STOP - 9A
This terminates underline mode. In this mode, mosaics
are displayed contiguously so as to form a monochrome
bitmap.

FLASH CURSOR - 9B
This cause the cursor to blink. It also may enable user
input if the active field is in an unprotected field.

STEADY CURSOR - 9C
This cause the cursor to be displayed with no blinking.
It also may enable user input if the active field is in an
unprotected field.
```

CURSOR OFF - 9D
This sets the cursor to its default invisible mode. The cursor still exists and can be positioned. This may also disable user input, but that is implementation dependent.

BLINK START - 8E
This creates a simple blink process using the current drawing color as the blink-from color and nominal black (the background color in mode 2) as the blink-to color. The on and off intervals are implementation dependent and the start delay is zero. This is intended to provide a facility similar to the ANSI graphics blinking found on PC's.

BLINK STOP - 9E
This terminates any blink process using the current drawing color as the blink-from color.

EDC1, EDC2, EDC3, EDC4 - 91, 92, 93, 94
These codes are reserved for future use. At the present time they should be discarded.

Proportional Spacing of Text

Overview
In order to guarantee the placement of text and the positioning of line breaks on varying implementations of NAPLPS at varying display resolutions, it is necessary to have some guidelines as to how to produce proportionally spaced text. If a terminal program adheres to these guidelines, then a host system can place proportionally spaced text onto the screen in a predictable manner.
An algorithm is provided which defines how far to move the cursor if the character field width is parallel to the character path. If it is not parallel, then proportional spacing is not possible and the spacing is always based on the full height of the character field. The spacing for the widest characters is always equal to the character field width, while the spacing for other characters is arranged so that the visible gaps between characters are identical. The algorithm is arranged so that normal size text will be spaced identically on both low and high resolution terminals.

Algorithms
The following tables classify the ASCII and supplementary sets into 10 different width classes. Characters in a given class are spaced according to the same algorithm over the range of font sizes.

ASCII Width Classes
2 3 4 5 6 7
----
0 9 5 9 5 1 5

```
1 0 1 5 6 5 5
2 4 5 5 5 5 5
3 6 5 5 5 5 5
4 9 5 5 9 5 2
5 9 5 5 5 5 5
6 9 5 5 9 5 9
7 0 5 8 9 5 9
8 1 5 5 9 5 9
9 1 5 2 9 0 5
A 9 0 5 9 4 5
B 9 3 5 4 5 5
C 3 5 5 9 0 0
D 5 8 9 4 9 5
E 0 5 5 2 5 9
F 9 8 9 9 5

Supplementary Width Classes
2 3 4 5 6 7
--------------------------------
0 9 4 9 5 6 9
1 0 9 2 1 9 9
2 9 4 2 9 6 6
3 5 4 2 9 5 5
4 9 7 9 9 9 6
5 9 6 5 6 9 0
6 9 9 5 9 9 4
7 6 0 0 9 5 4
8 9 9 4 9 9 7
9 1 1 9 9 9 9
A 6 6 1 9 9 9
B 8 8 7 9 5 6
C 9 9 9 9 5 4
D 7 9 4 9 9 2
E 9 9 8 9 6 5
F 7 8 2 9 9
```

The width class of an accented character is the maximum width of the two components. Note that the <space> character is always in the maximum width class. In proportional mode <tab> and <backspace> are always considered to be in the maximum width class (same as <space>) when they are received from the host system.
The algorithm that determines the actual width of a character is based upon the width class and the width of the current fixed character field. This algorithm is intended to make the interfont gap between all characters identical, so when designing your implementation dependent font, you should take this algorithm into consideration. The algorithm is structured to ensure that smaller sizes of text appear spaced identically in both low and high resolution video displays.

TEXT SIZES up to (but not including) 12/256 wide

width	0	1	2	3	4	5	6	7	8	9
6	2	3	4	3	4	5	6	4	5	6
7	3	4	5	4	5	6	7	5	6	7
8	2	3	4	4	5	6	7	6	7	8
9	3	4	5	5	6	7	8	7	8	9
10	4	5	6	6	7	8	9	8	9	10
11	3	4	6	6	7	8	10	8	10	11
12	6	5	4	4	3	2	1	2	1	0

The above table contains the cursor displacement to be applied to characters in each width class at various different character field widths. To determine which row to use, take the character field width (which is a binary fraction), multiply by 256 to get a number n.m/256, then truncate the fractional portion of the number to find n. If this result is less than 12, then use the corresponding row in the table and scale the character displacement. For instance, if the character field width is 15/512, then multiply by 256 to get 8.5/256. Truncate to 8, therefore use row 8 in the table. If the width class is 0 then the character displacement is 2/256 which is the same as 2/8 of the full displacement.

If the scaling result is greater than or equal to 12 then the 12 row is first scaled to determine the amount to adjust the character displacement.

1. The character field width is truncated to DOMAIN 3 leaving the 8 most significant bits. Call this n.
2. Multiply n by 11/13 being careful to avoid overflow.
3. Subtract 1/256 from the result, then bitwise OR the result with 1/256 and again subtract 1/256 from the result. Truncate this final result to DOMAIN 3, i.e. to 8 bits. This is the scale factor f. This step causes the font patterns for the widest character class to be scaled to an odd width.
4. Get the unit spacing number from the 12 row for the appropriate width class.
5. Multiply this unit spacing by f.
6. Divide the result by 6, then add 1/512 for rounding, then truncate to DOMAIN 3 leaving the 8 most significant bits. Subtract this result from n to get the actual cursor displacement amount.

For example, a character in width class 0 using a character field with of 12/256.

1. 12/256 is already an 8-bit value so it is n.
2. Multiply by 11 and divide by 13 to get a 16 bit number = 2599.
3. Result 2087 scaled down to 8 bits = 8.

4. Use 6.
5. 6 * 8 = 48, divide by 6 to get 8, add .5 and round down to 8. Subtract 8 from 12 to get a displacement of 4/256.
Similarly, if the field width is 24/256, then the displacement would be 6/256. This is a very tricky part of the standard to follow and it leaves a lot to be assumed such as 8 bit numbers being multiplied or divided into a 16 bit register. I hope that I got it right.

Ideas and Implementations

Terminal Programs
I have come across several terminal programs that support NAPLPS on the PC and one that supports NAPLPS on Amiga and Macintosh computers.

PP3 (Personality Plus III) SHAREWARE
This is the only terminal program I know that fully supports all of NAPLPS including bitmaps and DRCS characters. It is available in English and French versions which use a user customizable language file so it is easy to provide support for other languages. Supports CGA, Herc mono, EGA, MCGA, VGA, ET4000-256, TARGA-16. Basic registration fee is $25 while $40 gets you a printed manual and info on other NAPLPS products and services.

CTLINK
Hmmm. I seem to have deleted this one. I had some problems with it (which may have been the modem) but I remember that it was really oriented as a terminal for commercial videotex services. I read some comments from Dave Hughes that indicated it is not a complete implementation, but if you see it around, why not try it for yourself.

Tam Tam COMMERCIAL
This program is available from MacGregor Inc. in Montreal for the Amiga and the Macintosh in both English and French versions. The price was $79-$99 depending on which version but I have lost my info sheet. Just call directory assistance to get a hold of them. They do speak English just fine, so don't be shy.

Drawing Programs
To date, I know of only one shareware drawing program that supports NAPLPS. There are other commercial programs but I don't yet have any info on them. In addition, I have written a program to convert Windows 3 icons to NAPLPS format and have a beta version of a program to convert metafiles created by CorelDraw into NAPLPS format. The Memra logo in the sample file MEMRA2.NAP was converted from an original CorelDraw image.

MGE (Microstar Graphics Editor) SHAREWARE
This is an object oriented drawing (not painting) program from Microstar Inc. that uses NAPLPS as its file format. It can draw all the basic objects as well as providing control over text. It can define macros, fields and blinks. If using the VGA 16 or 256 color drivers, you can customize the palette. This is an important feature of NAPLPS. It is not restricted to the default DOS/Windows 16 color palette. On a standard VGA you can display any 16 out of the 262,000 shades it is capable of displaying. Notable omissions are NAPLPS bitmaps and DRCS characters. Microsoft compatible mouse required (or a graphics tablet that emulates a Microsoft mouse). This is a good program that is often criticized because its interface is not 100% the same as Windows, however if you do PRINT OUT the README.MGE file and keep it by your side while you draw, you will find that this program is every bit as effective as CorelDraw and a much better deal. Supports CGA, Herc mono, EGA, MCGA, VGA, ET4000-256, TARGA-16. Basic registration fee is $50 while $75 will get you a printed copy of the manual and info on other NAPLPS products and services.

Teledraw COMMERCIAL
This program is being developed by Dave Hughes in conjunction with a team of programmers in Russia. He has working beta versions and is expected to release the program by the end of April 1993. This program will provide full NAPLPS support including the design and use of DRCS characters such as the Russian characters used in SAIL.NAP. This program is a combination drawing/terminal program that will decode NAPLPS images in electronic mail on the fly and will allow you to draw or edit images and transmit them in electronic mail messages.

NAPICO SHAREWARE
This program from Memra Software Inc. is intended to enhance NAPLPS images created with MGE by adding Windows icons to the image. The icon positions are marked with a small rectangle and NAPICO takes a list of Windows 3 .ICO files and inserts the icon bitmap into those marked positions. The use of SMALL bitmaps like these icons can really enhance a NAPLPS image. A $10 registration fee is requested from those who can afford it.

NAPWMF SHAREWARE
This program from Memra Software Inc. converts Windows metafiles that are created using CorelDraw's File Export function. It does not necessarily work with metafiles from other programs, although full .WMF support will be included in a future version. This makes it possible to add a wide range of clipart images and True Type fonts to a NAPLPS image. See the Memra logo in MEMRA2.NAP that was produced by

a beta version of this program. The images produced by version 1.0 won't be quite as big.

TURSHOW SHAREWARE
This program doesn't fit under either category. It simply displays the NAPLPS images on your CGA, EGA or VGA screen.

Clip Art libraries
I would like to see people put together libraries of non-copyrighted clipart for use by others. Note that this means the images must be original art, not converted from a commercial clipart library. As soon as I get NAPWMF released, I will be creating a library of electrical symbols for use in drawing circuits.

ANSI compatibility
It should be possible for a terminal program to simultaneously support both NAPLPS and the ANSI-BBS protocol simultaneously. Because of a conflict with the FLASH CURSOR command, it is not possible to arbitrarily interleave ANSI and NAPLPS data streams but it should be possible to support both code systems in a non-interleaved manner. The NAPLPS spec uses the 3 character sequence ESC 25 41 to indicate that NAPLPS decoding is to be turned ON and the sequence ESC 25 40 turns OFF the NAPLPS decoding. Outside of this bracketing, it should be possible to support ANSI escape sequences. It is fairly straightforward for sysops to ensure that the ON/OFF sequences are transmitted, especially if they are using Microstar's SHOWPLP utility.

User Interaction
Although NAPLPS provides facilities for user interaction in the form of unprotected fields, the cursor and transmit macros, it does not require that those facilities be used when there is an application layer protocol for handling such things. I would like to suggest that the general BBS and NAPLPS community should agree on a standard way for handling such user interactions that would allow mouse and keyboard support in a non hardware dependent manner.
As for mice and other pointing devices, I would like to suggest that the terminal program transmit a POINT SET ABS (code 24) PDI to the BBS using the currently set domain co-ordinates to indicate a mouse click followed by some code to indicate whether it was a button-down or button-up event and which button it was. A POINT SET REL could be transmitted to indicate a mouse move event.
For keyboard events (key-up and key-down) a form of the PC scan-codes could be transmitted. These codes are also used by certain UNIX terminals and similar events are generated by Macintosh keyboards and X-Windows keyboards so

the only thing about these codes that is specific to the PC is the actual code numbers.
There should probably be some indicator code transmitted to distinguish between transmission of unprotected fields and transmission of an event. Transmit macros could, of course, be programmed to emulate either events or unprotected field transmittal or anything else.
I would like comments on these ideas, please.

Level 6 vs. Level 7
It is important to remember that NAPLPS exists at the presentation layer which is the 6th of the 7 OSI networking levels. It is intended to be used as the foundation for interactive on-line real-time graphical applications, which are at the 7th OSI level. NAPLPS does not do everything and it is not intended to do everything. I feel that it is important for BBS operators and users to start discussions on an overall standard for graphical BBS interchange, and I would like to see NAPLPS as the foundation for the presentation layer of that interchange. I would also like to see any overall standards maintain the OSI division into 6 independent layers.
It may be appropriate to extend NAPLPS to include additional G-sets and I know that there is already a JPEG extension to NAPLPS being prepared for public release. Since the BBS community is likely to be the major user of NAPLPS over the next few years, we need to maintain a discussion of this protocol and its implementations and suggestions for extensions.

Resource List

I have put a lot of work into writing this document and getting it widely distributed (worldwide). If you find it to be of use and can afford to, I would appreciate receiving $20 to help me continue to work on NAPLPS support.

Star Valley BBS 1-604-546-2705
- speeds up to v.32bis
- NAPLPS art galleries including some bitmaps
- look in file areas DOS.BBS and ART.NAP
- downloading available on the 1st call
- author of NAPICO and NAPWMF utilities
- Fidonet address 1:353/350

FREQ NAPLPS - This document
NAPICO - convert Windows 3 icons to NAPLPS
NAPWMF - convert CorelDraw images to NAPLPS
MGESHARE - Microstar Graphics Editor
PP3SHARE - Personality Plus 3 term program
SHOWPLP - door to add NAPLPS to your BBS
TURBOARD - BBS program with built-in NAPLPS

PC Atlanta 1-404-395-6327
- speeds up to v.32bis/HST
- home of Turboard BBS software
- full NAPLPS, ANSI, ASCII support
- sysop Shawn Rhoads
- Fidonet address 1:133/904
FREQ TB114.EXE - latest Turboard ver 1.14

Russell Country BBS 1-406-423-5433
- v.32bis
- home of Native American Share-Art
- sysop Cynthia Denton
- wonderful online art galleries
- Fidonet 1:3400/7

Microstar Support BBS 1-614-727-5272
- speeds up to v.32bis (I can only connect at 9600 bps)
- samples from many NAPLPS systems
- interactive NAPLPS game like Tetris
- the authors of MGE and PP3 and SHOWPLP
- NAPLPS message area
- Fidonet 1:163/537

Old Colorado City 1-719-632-2658
- David Hughes (dave@oldcolo.com) operates an
Internet/BITNET/Fidonet NAPLPS mailing list
- about to release Teledraw a combination NAPLPS
drawing and terminal program

Le Muse 1-514-984-1297
- 2400 bps
- an experimental electronic gallery
- text in French
- includes a selection of children's art

The Gadget Zone 1-604-946-5815
- speeds up to v.32bis
- home of the ONLINE_GRAPHICS echo message area
- many NAPLPS related files
- Fidonet address 1:153/951

Harris Technology Associates BBS 1-508-877-7233
- NAPLPS software for TBBS systems
- many NAPLPS menus
- several NAPLPS games
- illustrated electronic books

Hi Res BBS 1-306-782-6820
- some sample bitmaps converted to NAPLPS with a
commercial .PCX conversion program
- full NAPLPS support (running Turboard)
- sysop Warren Zatwarniski
- Fidonet 1:140/111

Online Acess magazine
the Summer 1992 has an article about several on-line NAPLPS art galleries. It includes several wonderful photos of sample NAPLPS artwork captured from a low-resolution 16-color video display

BoardWatch magazine
The December 1992 issue has an article on NAPLPS support by several BBS systems. It includes 6 color photos of NAPLPS screens.

Byte magazine
There was a series of 4 articles (55 pages in total) explaining much of the NAPLPS coding system and discussing the potential for NAPLPS. These articles were in the February, March, April and May 1983 issues. In the 2nd article, a small NAPLPS image is decoded and explained in detail. To recreate that image, cut out the following lines between the dashed ones and place in a file named BYTE.SCR. Then type DEBUG <BYTE.SCR This will create the image in a file called BYTE.NAP. If you are not using a PC, then you will have to find some other means of entering the hex codes into a document file. Note the picture will display in PP3 but is not editable in MGE. If you create BPREF.NAP and prepend it to the image by typing:
COPY BPREF.NAP+BYTE.NAP BEDIT.NAP
then you will create an editable version of the same image which will actually look more like the original as far as line thickness and line texture.
---------8X----cut here-------------BYTE.SCR follows---

COMMAND.PRG doesn't set shell_p. And COMMAND.PRG doesn't set COMSPEC :-)

That's csh ONLY. To any other Unix shell (ksh, bash, ash, sh) that
is an error. To redirect both, use:

make -d all >logs/make.log 2>logs/make.log

Or, you can redirect separately: (which you cannot do in csh/tcsh)

make -d all >logs/make.out 2>logs/make.err

I'd make a rude comment about how bad csh is, but I know tcsh is Eric's
favourite, and don't want to offend him ;)

Indeed. That says that *GEMDOS* doesn't define this. In fact it says that there are no special text files for GEMDOS, and that GEMDOS files may contain any characters. It only documents the behaviour of applications (possibly DOS or CP/M) which were used back in 1985.

What I want to say: programs that still insist in writing ^Z at the end of a text file, should be changed. BTW: programs that can't read text files without carriage returns should be changed, too (this should be a basic capability of stdio and makes life easier for everyone).

> description of use of stdout and stderr in MAKE.
(from the POSIX docs)

Actually, it wasn't MAKE I was concerned about, it was (as the message stated) the compiler pieces that make up HSC. MAKE itself is pretty easy to figure out: if it's not an error, it goes to stdout.

[...]

Using unix docs to decide on the behavior of Atari ST programs strikes me as a mixed-bag concept. First you have to have the unix docs, of course. Then, I guess you have to think unix is something worthy of emulation. Actually, given a choice, I'd tend to look to other ST tools first, like Lattice C. In the absence of that, I'd go next to MSDOS prior art. Wherever possible, however, I try to do things that won't disorient anyone, be they unix-head or msdos'er or GEM lover or Macintosh worshiper or whatever. Rather than worshipping at the alter of some arbitrary standard I prefer to make things easy for everyone, to whatever degree possible.

The docs that were quoted weren't UNIX ones, but the POSIX standard. As I understand it POSIX is supposed to allow OS independent access to system services. VMS now claims POSIX compliance, and I doubt if anyone would claim VMS is UNIX.
Looking to MSDOS for guidance seems crazy to me, given that Microsoft based their (poor) CP/M derivative on early UNIXes. If it's different from the behaviour of UNIX that's simply because they got it wrong ("What! MicroSoft got it *wrong* ?" :-)

As it looks like MTOS, BSD, SVR4, VMS, NT (and did I mishear a rumour that IBM were working on CMS ?) are converging on a POSIX API (underneath they can be *very* different), the POSIX standard seems to be the one to follow.

It could also be mentioned that the distribution kit contains all necessary files for getting GCC up and running, even though you are not necessarily getting the absolute latest versions.

I really can recommend the distribution kit if you are not all on the inside with all the strange and mysterious packages that makes a unix(-like) system. The distribution kit automates the process and gives you a ready-to-run environment, and a great way to keep a backup of your setup in case your harddisc gets corrupted during the first period of raving around in the candy shop (happened to me a couple of times!).

Hi,

I have been asked this question by a friend who has a MegaST. If you can help,
please reply by email so I may summarize for him (and for anyone else who asks).

The question is simply....

Are there extended handles for the Bcon* calls for using the extra
serial ports found on a MegaST? If so, what are they.

Thanks,
John

I've never made any use of _shell_p so far, but to me it seems to
be a valid point that a technique of calling a shell by jumping
through a pointer may cause problems in a memory-protection
environment. It may be safe if the shell program's flag are set
to make all its memory publicly accessible. Otherwise, when the
shell code tries to access the shell's private memory after
having been called via _shell_p, the OS will think the calling
process tries to access that memory and punish the caller.
Am I wrong here? Or, if not, which mechanisms should be used for
calling a shell under MiNT/MTOS?

Gee that's interesting. I've got v5.52, and it didn't come with a make
at all. It also didn't come with a functional 'cc' type program, but after
I asked about how to use it properly from the command line, Alex sent me a
program called LCC.TTP that works very nicely. Still no make, though.

Does that work on the ST? I haven't seen anything that indicates that it's safe to have two standard handles pointing to the same file, with output going to both of them simultaneously. I would rather expect it to lead to file or disk corruption unless Atari explicitly planned for such a thing to be happening. (Specifically, I'd expect the filesize in the directory to reflect the number of bytes written to whichever handle was closed last. And who knows what the FAT chains would look like.) And this is not to mention the strange interleave of output you'd get due to the streams being buffered because isatty() for them is false.

2675. using SLIP on an Atari ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-05 17:42:05 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <C6KEnM.28o@news2.cis.umn.edu>
Source record: 38726

I have a Mega 4 ST, a 9600-baud V.32 modem and a number to our campus SLIP service. I would very much like to be able to use SLIP for things like anonymous FTP and telnet from home. I have a copy of the NEWNET archive from the atari.archive server, and documentation from the KA9Q documentation archive. The problem is that the documentation doesn't mention anything about using BOOTP services (for example), or exactly how to set things up, let alone dial into a SLIP server and make connections.

I would appreciate sample setups, scripts, helpful hints. You can send me e-mail and I will follow the advice and summarize once I've been successful in getting things working properly.

Oh yes, our SLIP service uses TACACS to validate the session, so there should be some method of dialing, issuing a username@host.domain and password and starting a telnet or FTP session. If one can run gopher or POPmail it might be very good to know that as well.

Asking a lot, expecting some helpful replies and waiting to let you all kow (er, know) how things turn out, I am

Okay, I've jus managed to get all the parts, and opened up my STFM
to install the overscan, and then found out that the parts shown in
the diagrams, don't seem to exist!

The diagrams are for a revision F STM motherboard, I have a revision
D STFM motherboard.

Will the overscan go into a machine with a Rev' D, STFM board? If so,
is the 'modulator' the RF-Modulator? In which case, where on earth are
the pins for it, as the thing is encased inside a metal box, and then has
a small board soldered below that....

I also can't seem to locate the appropriate chips & resistors etc.
(It says there is a L26 resistor to the right of an MFP 68901 chip, which
doesn't exist on this board (none have that serial # printed on it),
and further to the right is a C16-resistor, which is beside the MMU (which
I'm not sure of which-chip it is anyway, as the only square chips (the
MMU in the pic' is square, not rectangle), are 2 near the bottom of
the board (One I presume is the processor).

Can anyone out there give me any help at all? As 640*200 is getting
me down! :)

Anyone successfully put O-scan into an STFM? How & Where!?

E-Mail replies would probably be best to save bandwidth!

"Boo" ?? The fact is, the ST's history has been pretty chaotic, and it's hard to remain fully backward compatible with all the mess that's gone before, and still provide a reasonable system. Unix uses the TMPDIR variable to specify the location for temporary files, MSDOS semi-consistently used TEMP. GCC for the ST has to recognize both, because a lot of Atari software packages (like Mark Williams C, for one) used different (MSDS vs Unix) conventions... I guess the ST C library checks for TEMP before TMPDIR. Oh well, liv'n'learn. It would be nice to eliminate the plethora of inconsistencies, but it just isn't practical. (Further example - I've had TMPDIR, TEMPDIR, and TEMP all set in my environment, just to please all the various archiving utilities I've run across. Just can't win...)

>"Boo" ??
Yes! In spades! With bells on! :-)

What does it matter that other packages may use other environment
variables? Or that some other platform uses some other convention?
If the gcc docs that come in the gcc for ST archive don't
tell the truth about what gcc expects *on* the ST, "boo" is by far the
nicest thing to be said about that particular feature.

(And the error messages. . . . Mini-flame available on request, or at
the drop of a hat.)

2680. TeX documentation : English?

I give in. Does anyone out there have a copy of the original ADHI disk ??

I am trying to re-format my SH204. I have tried ADHI 5 and AHDI 6, but
they insist that `This HD is incompatable with an Atari ST' and request
that I find another WINCAP file.

My original AHDI disk is knackered, and no amount of giggling with the
WINCAP file (from all versions of AHDI) will get it to recognise the
SH204 --- an atari hard drive !!

Could anyone that might be able to mail me a uue'd ORIGINAL ahdi disk,
please email/post ... or if you know a solution (eg. another formatter),
tell me (here or e-mail me)

If I can't get my hard disk re-formatted, I'll cry ...

Dave.

>process tries to access that memory and punish the caller.

What if the shell you're trying to call doesn't even exist any more?
_shell_p is fine as long as you can guarantee that the code you are calling
is going to be there, but under a multitasking environment this is not the
case. The program wishing to call a shell may have been sent into the
background and the shell exitted.

>Am I wrong here? Or, if not, which mechanisms should be used for
>calling a shell under MiNT/MTOS?

Either:-

(1) Use the system() system call.

or:-

(2) Use fork() and exec() to run a new shell.

or:-

(3) Use a spawnv() varient to run a shell.

All of the above effectively do the same thing, start a new copy of the
shell program giving it arguments.

Having discovered that Install Application (at least on TOS 1.6) "works"
in such a marvellous way that applications can't even find their own
resource files (sigh), do the alternative desktops do this any better?
Do Gemini or Neodesk change the current directory to where the program is
before running it? And then properly pass the full path of the data file?
What does TOS 2.06 do with this? I presume the "drag and drop" feature
properly does a cd?

This nightmare scenario would only be true if the blitter hogged the bus completely while doing the scroll. It can be programmed to work this way, but normally bus access is interleaved between the CPU and the blitter.

Ergo, you can still service MIDI interrupts while doing blits.

You need the IBM version, as this has a parallel printer port on it that
will hook up to the ST using a standard PC to parallel printer cable.

You will need new software drivers -- it's a different printer! Fortunately,
such drivers are easy to come by. FontGDOS includes a deskjet driver, and
there is one for That's Write. If you can't find one for any other
applications, you can get away with using a Laserjet II driver -- but it'll
be rather slow.

or
make -d all 2>&1 >logs/make.log

i think. the "2>&1" tells sh to combine the two streams associated with file descriptors 1 and 2 (stdout and stderr) into one (stdout). which is then redirected. i am not sure if the results are totally identical (ie the order in which lines appear).

interesting sidebar: stdout when going to tty is line buffered, but when piped is buffered by stdio (unless setvbuf with _IO* mode, say _IONBF). this of course is under unix (at least BSD). i have no idea what the effect is with MiNT/gcc stdio.

>Or, you can redirect separately: (which you cannot do in csh/tcsh)
>
> make -d all >logs/make.out 2>logs/make.err

yes, u can:

(make -d all >logs/make.log) >& logs/make.err

where stdout goes to logs/make.log and stderr goes to logs/make.err, tho at the cost of another shell. i often (daily?) do this with things like:

(time a.out >output) >& timelog

(both /bin/time and csh time writes to stderr). clearly sh/ksh is more flexible, at least in this respect, and especially for scripts. however, i still prefer (t)csh for interactive because it has much better builtins (eg time). when u work on systems with GB's of physical memory, you don't worry too much about the odd extra 1 MB csh process :-).

lesson learned: "never say anything is impossible..." :-)

ciao

Teradesk gives you the option to change dir before starting an
installed application. Great stuff. Drag and drop should of course work
since the drag just passes the complete path and filename to the
application invoked (in it's own dir).

Yes, this is fixed in TOS 2 upwards. An applications can be assigned a
default directory. You can solve your problem by setting the PATH
environment variable using a program like ENVIRON.

PM> rez video output.

Well, I'm currently working on getting what appears to be just such a monitor working on my TT. (It's actually a Philips design, the Apollo part number is 008399)

It has the differential ECL video inputs and TTL sync inputs that it needs to talk to the TT with, however both sync signals need to be inverted (I'm using a 74HC00 on a small patchboard).

The biggest problem I'm having is that the video signal out from the TT is disgusting. Now, I've seen the picture on a TTM195, and it's brilliant. Large white reguins are large white regions, there's no vertical banding (I get some on the colour screen, but _heaps_ on the mono one), no ghosting (I get that too 8( ) and no pixel-jitter.

I'm going to try popping the case on the TT and hunting down the output buffer and decoupling it to death, but if anyone has any other suggestions I'd be endlessly grateful if they could pass them on.

Surely _someone_ else has had this problem and solved it.

Hi!

I'm looking for infos how to switch on or off the cache on the Maxon Board 20 accelerator.

I'm writing a program to configure the hardware for max. speed at bootup, but it still works just for Mega/STE really good. I need some infos about all the usual accelerators (including TT - :) and save ways of detection, if possible.

Thanks!

ketchup

2700. High speed modem question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-09 01:54:30 UTC
From: boyd@gauss
Message-ID: <C6qLAu.HKD@mailer.cc.fsu.edu>
Source record: 38650
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a PPI 9600SA modem, which can do V32/V42bis. My understanding is that, with data compression going, the theoretical maximum speed data can be transmitted or received is 38400 baud. Thus, one's modem program should be set to this speed. If one does not set the modem program speed to be greater than 9600 baud, then no benefit is gained from data compression.

Now, on to my question. The fastest speeds I have attained with my modem (ymodem text download of a large English text file) was about 1100 cps. I am using Uniterm (set at 19200 baud, since this is the fastest the modems on the other end can go), Serial Fix 2.0, and was connected v42bis (data compression and error checking on). This type of file should have made good use of the data compression stuff, so I was expecting to get closer to 2000 cps (if not beyond). My questions are as follows:

1. Was this a reasonable expectation? Am I really losing performance?

2. Is there any advantage to using hs_fix.prg instead of Serial Fix 2.0? I think there is something in the documentation about making serial buffers bigger. Is this where I am losing my performance?

3. How does the cps rating work exactly? I am currently interpreting it to mean "8-bit characters per second", so 9600 baud = 9600 bits per second = 1200 cps (max). Is this correct?

When I download binary files, I get 830-880 cps. The machine is a Mega2ST. Thanks in advance for any comments.

NO its 9600/10, there are 10 bits to every 8 bit data byte..

>When I download binary files, I get 830-880 cps. The machine is a Mega2ST.
>Thanks in advance for any comments.

Using V42bis on compacted data slows things down a lot..

So to get a good throughput with text data you will need a port speed of
4 times 9600, (V42bis has a claimed 4:1 compression ratio with text data) so
thats 38400, I don't think that a standard Atari could even keep up at that
speed, there are Hardware mods to get this port speed, but they are in German,
RSVE1_1.LZH is the file that I am thinking of, but then again can the software
keep up..??

2703. GDB in multiTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-09 15:48:04 UTC
From: erlingh@idt.unit.no
Message-ID: <1993May9.154804.19855@ugle.unit.no>
Source record: 38653

Hi.

I just have to share my experiences with the new GDB (3.6) for mint/multiTOS.
Now I'm running GDB as a subprocess under Emacs (the way God intended), and
everything is working just great !
I really believed I was going to crash *horribly* when trying to debug a
GEM-program, but that worked really nice as well. (Note, MultiTos only)

The only problem comes if you try to step through some code that does
a wind_update(BEG_UPDATE)... :-)

Thanx go to Joerg.Hessdoerfer@EUROPA.rs.kp.dlr.de for his port of gdb !!!

For those of you not known with gdb/emacs, this combination lets you
view your source-code in one editor-window, while gdb itself runs in another.
As you step through the code, an "arrow" in the source-code window indicates
which C-code line is being executed.
This combination is probably one of the best debugging environments that
exists on the Atari.

Check it out !

2705. Need help recovering deleted file!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-09 16:06:24 UTC
From: zimmermk@westford.ccur.com
Message-ID: <1993May9.160624.2876@westford.ccur.com>
Source record: 38655

Hi. I have an Atari 1040ST with GEM and TOS in ROM (versions from
aroung 1985). I've accidentally deleted a file AND overwritten the directory
entry. I've found my data using a sector searching program, but I don't know
much about TOS internals -- specifically, I don't know what a cluster is
exactly, and I don't know the format of the FAT. What I need to do is to be
able to create [a?] cluster[s?] in the FAT that will imply that a certain
set of sectors is "in-use"; I gather from what documentation I have that the
first cluster must be marked "Start", and that the last cluster maybe should
point to an "End-of-file" cluster, or something like that, but I'm not sure
of the details. If I can do this, then the data will be recognized as an
"Orphan" file, and I've got a program that I can use to get it back.
Do you know of either (1) a program that I can get TODAY that will
recover this data for me, or (2) an ON-LINE source of documentation that will
describe the FAT and clusters? If you do, PLEASE drop me a note at

zimmermk@westford.ccur.com

!
ADVthanksANCE !

Karl Zimmerman

That's correct. However, the theoretical maximum really is
theoretical, it is only achieved on _very_ loosely typed textfiles.
One way is to make a file with say 100KB of the same letter all the
way, that should be the most compressable file.

>Now, on to my question. The fastest speeds I have attained with my modem

>the data compression stuff, so I was expecting to get closer to 2000 cps
>(if not beyond). My questions are as follows:
>
>1. Was this a reasonable expectation? Am I really losing performance?

This was totally normal. The reason for this is that you were using
Y-Modem. Ymodem transmits a checksum after every 1024 bytes, and that
takes processing time. On a slow connection it doesn't show very much,
but on faster connections it really affects the overall performance.

>2. Is there any advantage to using hs_fix.prg instead of Serial Fix 2.0?
> I think there is something in the documentation about making serial buffers

At least not speedwise, I think. However, I have had problems with
Serial Fix 2.0 (and 1.x) when used in conjunction with XYZ.TTP
(version 2.02 beta, and 2.01). Whenever I upload something, XYZ
doesn't seem to detect the end of the file, it just begins
time-outing. I use HS-Fix 1.4 and it works nice.

> bigger. Is this where I am losing my performance?

I really doubt it. I have never had to alter my buffers to gain
performance. I think your problem is Y-modem, in fact I am sure of it
:).

>3. How does the cps rating work exactly? I am currently interpreting it to
> mean "8-bit characters per second", so 9600 baud = 9600 bits per second
> = 1200 cps (max). Is this correct?

That way you only get a _very_ theoretical maximum. If you have an error correcting connection (MNP 3-4 or V.42), then the modems don't use start and stop bits, like on normal non-error-correcting modems, where 10 bits are transferred for every byte (8+start+stopbit). Thus, you would think that you'd get the actual speed by taking 9600/8=1200, but as the error correcting protocol has to re-transmit faulty data due to line noise, and because it has an overhead (it calculates checksums etc), the actual speed is gotten by dividing the BPS rate with a number somewhere between 8 and 10, for me it is a little under 9.

>When I download binary files, I get 830-880 cps. The machine is a Mega2ST.
>Thanks in advance for any comments.

I guess this is normal when using Y-Modem. If I were you, I'd change to Zmodem as soon as possible. Zmodem doesn't need to stop every 1024 bytes, it sends the checksum in the same "packet". Zmodem is much more advanced than Ymodem in every way, you can for example continue to transfer from the middle of a file if you for some reason couldn't transfer the whole file in one go. I use XYZ.TTP, it takes about 24 KB diskspace PFX-packed, and it (version 2.02 beta) can do X, Y and Zmodem, and Ymodem-G also which is even faster than Zmodem (only slightly). I've been satisfied with this utility, but there are many other external protocols for Zmodem as well, and many terminal programs have Zmodem built-in. If you want to use Uniterm, be sure to increase the system buffer (did I get it right?) so that you can run programs. If the system buffer is 0, you will not be able to run any external programs from Uniterm (I think).

The transfer rates you will get with Zmodem are (estimates):

Archived files (.LZH .ZIP .ARC .ZOO .ARJ and some others) ~1100 CPS
Text files ~1900 CPS (depends on textfile and where you download to)
Binary files ~1200-1900 CPS, depending on the specific file.

If you download to a floppy disk, performance will drop quite a lot. Use hard disk or RAM disk for optimal performance. Oh, and you will not get more than ~1920 CPS in any case because the serial port of the ST doesn't go faster than that. It is possible to do some hardware modifications to improve the speed however.

That is only the case without error correction, because error
correction makes the connection synchronous and eliminates the
start&stopbits.

] Using V42bis on compacted data slows things down a lot..

Not really, using V42bis causes virtually no-slowdown whatsoever on uncompressable data. MNP-5 slows things down a lot however!

I have my modem software set at 19200 with RTS/CTS flow control turned on, and the modem connected at 9600, I usually get around 1100 when I'm uploading or downloading! (I only use v42 not v42bis, as it doesn't work too well with my setup!)

>(if not beyond). My questions are as follows:

I had good experience with TurboCTS, it not only fixes the handshaking
problem, but it is a better serial driver too. I was using ICDAdspeed on a
Mega4ST TOS1.4 though.

>
>1. Was this a reasonable expectation? Am I really losing performance?

Not too reasonable, and yes you are loosing performance. The main
reason would be the modems limited buffering. When it uncompresses the
incoming data, it has to get rid of it fast when there is no more
internal buffer space, or it will have to slowdown the incoming data.
That is why you need a connection speed equaling to the maximum possible
data tranfer. Since there is a delay involved in starting and stopping
the flow, you are basically reducing the raw transmit capacity that is
being used. Also, the ST series are barely able to cope with such data
at 9600 abuds when running at 8 Mhz, and that is with very good drivers.

>
>2. Is there any advantage to using hs_fix.prg instead of Serial Fix 2.0?
> I think there is something in the documentation about making serial buffers

TurboCTS is my favorite.

>
>3. How does the cps rating work exactly? I am currently interpreting it to
> mean "8-bit characters per second", so 9600 baud = 9600 bits per second
> = 1200 cps (max). Is this correct?

Nope, 1 byte tranferred from the modem uses anywhere from 10 to 11 bits.
Startbit, 8 Databits, 1 or 1.5 stopbits. Also, there is some delay
between the two frames as well.

>
>When I download binary files, I get 830-880 cps. The machine is a Mega2ST.
>Thanks in advance for any comments.

Also consider the machine you are connected to. I figure that most bbs'
are not connected to their modems with 38400 bauds. Some are just at
9600 bauds. In that case, you wouldn't be able to transfer more with a
Cray computer on your end.

2712. wind_set(WF_KIND...) and appl_tplay

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-10 08:54:13 UTC
From: avgroeni@cs.ruu.nl
Message-ID: <1993May10.085413.13194@cs.ruu.nl>
Source record: 38662

A couple of questions:

1. Has anybody ever tried to change the attributes of a window that is already open, for example: you've got a window with a closer and a fuller and temporarily want to make the window 'modal' (i.e. you cannot leave it unless you choose one of say two exit buttons inside the window). You would:

```
w = wind_create(CLOSER | MOVER | NAME | FULLER, ...)
; wind_open(w, ....)
; ...
; ...
; wind_set(w, WF_KIND, MOVER | NAME)
```

This doesn't seem to work: the window closer and fuller are not removed. However, they no longer work. Does anybody have a solution here?

2. Starting from what GEM number does appl_tplay/record use 8 byte records? I reckon it must be 1.4 (since that is the GEM number of TOS 1.4--1.62) I don't seem to be able to place the mouse at all using appl_tplay under MultiTOS!?

Oops, I didn't know that you still needed the WINCAP file for SCSI drives!

I tried once the same thing myself, but it did not work. I wanted to iconify
a window, so that all gadgets were gone, but the AES does not want it :-(
A solution is to close the window, delete it, and create another one with
the right gadgets. But be sure to put these AES calls into wind_update
braces, so nobody else is abel to steal the window id (is this correct?).
In my program, it worked; and I saw the same solution in Eric's TOSWIN
sources, so it seems to be the only way, but maybe Eric can say something
more on this point.

2716. MTOS availability in UK

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-10 11:08:28 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <C6t5M6.FMp@cs.bham.ac.uk>
Source record: 38678

I've just seen an ad from Hisoft announcing MultiTOS and Speedo availability on May 22. The combined cost was about 50 pounds, which is somewhat less than I expected (for all the fonts etc).

Is this method of distribution a Good Thing(tm) or a Bad Thing(tm)? IMHO, the people likely to want MTOS are also likely to be customers of Hisoft. Also Hisoft are less likely to make a hash of the package than Atari UK.

I didn't know, either. You definitely don't need it for SCSI drives. HDX
sometimes complains when the disk hasn't been formatted by HDX but by
another software and doesn't allow partitioning, then. In this case another
program for partitioning will do.

2720. GEM-View distribution (was: A matter concerning lexicor and cybercube)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-10 12:08:48 UTC
From: fiebelko@bonny.informatik.uni-dortmund.de
Message-ID: <1slgkgINN8aj@fbi-news.Informatik.Uni-Dortmund.DE>
Source record: 38667

Hi folks,

For the first: NOONE has a contract of "exclusive rights for distribution"!
"exclusive rights for distribution" meens: If there is any person/firm
which should have it, no other can selling the programm (in this part of
the world)! !!!!!BUT ALL EXISTING VERSIONS CANNOT SALE (it's Shareware)!!!!!

Second: GEM-View is SHAREWARE up to version 2.24 and anyone can get it
from GEnie without pay for it. (A commercial version don't exist in this
moment!) The SHAREWARE-Version can be copy free and MUST be registered,
if it is used, by myself and the shareware-fee must paid to me. To make
it easier for users in USA/Canada, Cybercube can answer user-questions/
user-requests and make a list for all the persons, who are interest in
registration. I will get the list and the money; the registration will
be made by myself. This is a user-support not a "rights for distribution",
i think! Lexicor has not this right of user-support!

If there is any, who asserts, that no shareware fee must be paid for the
existing versions of GEM-View (less or equal 2.24), is wrong!
If you use GEM-View, you must pay the shareware fee (DM 30,-- or US$20,--)
to me, the registration will ONLY made by myself!

!!!!!!!!!!!!!!!!! ALL OTHER ANNONCEMENT ARE WRONG !!!!!!!!!!!!!!!!!

NO DISCUSSION ABOUT RIGHTS OF DISTRIBUTION FOR GEM-View IN "comp.sys.atari.st".

This is a warning to Lexicor and Cybercube!

2721. Mouse droppings sighted...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-10 13:41:43 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <1slm2n$e6p@rw8.urc.tue.nl>
Source record: 38669

Hi,

today I have this little sort of techie question for you Atari -Gurus.
Short and simple:
What has happened when I get to see mouse droppings? That is, when
something in screen updating goes wrong. Sometimes the wrong
mouse-pointer surroundings are displayed when redrawn. I suspect it
comes from a program that did not exit cleanly, or it could be that my
desktop program (Teradesk 1.24) has a bug or was damaged by some
program that ran.
If I know the source of the problem, I can maybe write a small program
that fixes this when this has happened, and also prevent this sort of
things happening when someone has run applications written by me.

Any help or explanations are appreciated.

I have to intervene... it was NOT ME, that did the port of GDB 3.6, that was Andreas Schwab (schwab@ls5.informatik.uni-dortmund.de). I did just an inferior port of GDB 3.5 (not too much worth, quite buggy), and pointed out where to find Andreas' version. So all credits go to him.

As with the rest, I'd have to agree... except that the PureC debugger is very well done, too. It just can't cope with my graphics card...
(The funny thing is: the old one (V1.0) could, but it couldn't handle MultiTOS, and fu**ing V1.1 handle MultiTOS, but not MY CARD!!! (SANG MV300))

Source record: 38671
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks to all who responded! As it turned out, I found a workable solution JUST AFTER I'd posted (of course). I'd been using the sector dump & search program in the TOOLS18 package from ftp.hyperion.com. Another package at that site, DFSUITE2, has a verrry simple program to move raw disk sectors between disk and memory, and between memory and files. Voila! I mapped out my file, copied each part to memory and thence to a file! I'll post a summary of responses in a short while (must attend meetings, etc.)! My impression of available support for the venerable 1040ST has improved muchly!

2724. GCC: funny behavior of floor()

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-10 14:21:01 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <1slocdINN1cu8@rs1.rrz.Uni-Koeln.DE>
Source record: 38670

Hi folks,

I have just run into a funny feature of the floor() function of
gcc: it sets errno to 63 when an argument between 0.5 and 1.0 is
passed to it. The return value seems to be correct, though.
The errors occur with -l pml and with -l pml020. I found these
portable math libs at some German ftp site (don't remember which
one, probably ftp.uni-muenster.de or athene.uni-paderborn.de),
archive name was something like pml20.zoo.
I have appended a program that produces the error on my system
(TT with 8 MB, if that makes any difference). Any help is
appreciated.

Hello,

I'm writing a program which uses the Rwabs system call
to read sectors from floppy en hard disk. But when I use the
program right after boot-up Rwabs is doing strange things, and
under gemini I get a BIOS error (abort/retry/ignore). When I
use something like 'ls' first on 'a:' there is no problem. I
get the same problem with Getbpb. Is there any knowledge about
this problem? I use the read/write call which ignores media change.

De Mazzel, Gerco (bcballi@cs.vu.nl)

PS: On my hard disk there is no such problem.

>It could also be mentioned that the distribution kit contains all necessary
>files for getting GCC up and running, even though you are not necessarily
>getting the absolute latest versions.

I was working on a document to fully describe how to compile MINT from the MDK. Unfortunately my heaviliy modified 1040ST with nearly every add on possible burned out. My hard drive also went out (actually I think the hard drive was the fault, becuase brand new the hard drive didn't work on a friends 1040ST and also burned out shortly after being connected to the drive). Anyways, I wonder if I should write a shell script for the MDK instead. That was the use simply installs the base configuration with the GCC and then runs a script. The problem that I saw was that newer versions of mint seem to need differentt files (some miss asm.y, which others use a prgflags.prg which the ST doesn't have, need, or use). I would be willing to try, but I am not going to have a working machine for a few more weeks.

When I begin work at IBM developement, I will have to sign a contract unconditionally giving then all of my intellectual property. I'm afraid that I will not be permitted to do any IBM un-authorized programming which leaves me unable to contribute to the Atari community. I think IBM is afraid that I'll give some piece of their PC operating systems AIX and maybe OS/2 away to MultiTOS.

Does anyone know how to copyright ideas for software before going to work for a large corporation. I don't want to make any money off of this software, I just want to learn and become known in the Atari community. Some of the things I have worked on designing (no code just data-flow diagrams and structure charts for the algorithms) are:

- NeXT Step like login for MiNT and MultiTOS (set's user id)
- Updated C language version of UniTERM
- A fully functional version of Korn Shell for the Atari
- TeX / LaTeX tools and TeX installation information for TOS and MutliTOS/MiNT

Other products I have already built for School projects are:

- A Multi-processor computer using M68332 (68020 like chips) and an operating system for it. Both a hard ware and software design

- An artificial intellegence scuba-diving partner to warn the diver about unsafe diving conditions BEFORE the diver encounters those problems. Also monitor's the diver's body conditions.

- An Ethernet network analyzer which gathers information on multiple Intel Based PC's equiped with Ethernet cards, several RS-232 serial connections to a central Unix Workstation, and an X-Windows interface to graphically show statistical information and to show raw ethernet data for packet tracing.

Is a statement like this to the UseNET a good enough copyright? I don't want to be unfair to IBM, but I would like to still work on these projects without having to worry about breaking the law. This is USA law.

2728. Bootup sequence?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-10 19:09:02 UTC
From: krakoverj@immunex.com
Message-ID: <1993May10.110902.82@immunex.com>
Source record: 38679

Well I was doing some hardware hacking this weekend and I ended up with a dead computer, even after I took all my hacks out.

I was wondering what is the bootup sequence of a mega4, I know it checks it's memory and looks at available drives, but unfortunatly for me, mine does nothing now. No image on the screen, no drive check.

Does anyone know of what lines I can check to see if it is passing the memory check or any other tests it does?

As it is now, on restart, the address and data lines toggle for a few useconds as does the reset line on the 68000, however, the halt line on the 68000 stays low, I think this means a bad address?

Any ideas,
Thanks,
Jonathan

> intellectual property agreements

Generally aren't worth sh*t. When I was working at Jeppesen, a friend of mine who was the VAX/VMS systems programmer developed a disk compression/defrag utility. He did it at the direction of the company, on company time, and under the terms of a standard intellectual property agreement which all employees had to sign.

He's now fairly wealthy from selling this program as a product. The company tried to sue him, but were advised by their lawyers that they'd lose and there was really nothing they could have done to prevent it. Apparently, if you think it up, it belongs to you as well as the person you were working for, regardless of prior agreements. (You can, however, sign away your rights to patent something. Apparently this is because a patent is a tangible thing you can give away your rights to, unlike an idea.)

This is not a legal opinion. Your mileage may vary.

Not really, useing MNP5 on compacted data slows down things. V42bis packs
the data, then checks if it is smaller than the original one. If so it
sends it. Otherwise it sends the original one.

MB> to this speed. If one does not set the modem program speed to be
MB> greater than
MB> 9600 baud, then no benefit is gained from data compression.

True, the speed should always be higher than 9600, (where your modem is concerned) so 19200 is a good choice. The chance of achieving a throughput of 38400 is so immensely small that I wouldn't bother with it.

MB> Now, on to my question. The fastest speeds I have attained with my
MB> modem (ymodem text download of a large English text file) was about
MB> 1100 cps. I am

Always try to use ZModem whenever possible. It's the fastest and most reliable protocoll widely available. On 9600bps I achieve CPS rates around 850 with Y-Modem in contrast to 1100 with ZModem. (on binary files)

MB> 1. Was this a reasonable expectation? Am I really losing
MB> performance?

Lots of factors can be of influence, the quality of the line for one. The datacompression offers an increase in throughput, but it always is smarter to pack your files before transferring them. This way your throughput always is as high as possible, since eg. ZIP always is better than V42bis.

MB> When I download binary files, I get 830-880 cps. The machine is a
MB> Mega2ST. Thanks in advance for any comments.

As stated above try to use ZModem. With YModem, the receiving end has to acknowledge after every package, so typically after every Kb transmitted. This reduces throughput enormously. ZModem only acknowledges when there is an error, otherwise the sending party just continues sending data. Another thing you may want to try is turning off MNP5 if available. MNP5 is a datacompression technique, but unlike V42bis which checks if the compressed data actually is smaller than the original one (if packed data eg. ZIP is packed again useing MNP5 it becomes larger) and if so send it, if not it sends the original smaller data, MNP5 doesn't do that, it just sends. So if you transfer packed data with MNP5 on, you will lose performance, since more data will be send than without MNP5.

My modem always has MNP5 disabled, V42/V42bis and MNP 3 and 4 enabled.

Hope this helps!

2732. Lattice C 5.52 STDARG.H bug

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-11 00:07:11 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993May11.000711.4435@mnemosyne.cs.du.edu>
Source record: 38681

I've discovered a bug in the Lattice C v5.52 STDARG.H file. If you're using 32-bit int, and try to use 'short' or 'char' as a datatype in a variable arguments list, the arguments are accessed incorrectly. For example:

```
void foo(short option, ...)
{
va_list args;
short thisone;

va_start(args, option);
thisone = var_arg(args, short);
va_end(args);
}
```

Incorrect code is generated for both the va_start() and va_arg() in this example.

The fix is to modify STDARG.H, replacing the #define __va() with:

```
#define __va(a) ( (sizeof(a)+sizeof(int)-1) & ~(sizeof(int)-1) )
```

And replacing the #define va_arg() with:

```
#define va_arg(a,b) (((b *)((a) += _va(b)))[-1])
```

Note that the bug happens only if you're NOT using the type-based stack alignment option (-aw). Also, the fix only works when you're not using that option. (When you are using that option, the current file works fine. There is no way to fix STDARG.H to work both ways, since LC doesn't #define a macro to indicate type-based stack alignment is in use.)

```

> This is a user-support not a "right for distrubution", I think!
> Lexicor has not this right of user-support!

Ummm, I hate to have to tell you this, but: You have no right to deny user support rights to other parties. Anyone in the world has the right to sell support for any product, freeware, shareware, or commercial. They can charge anything they want for the support and are not obligated to give you any of the money they make. If the product is freeware or shareware, they have the right to distrubute your product for free, and charge for the support. They do have to make it clear the payment is for support, and does not remove the user's obligation to pay the shareware fee to you if they use the product.

The Radical Eye company makes a living selling support for TeX. Other companies make their living selling support for GNU software. They cannot charge for the software itself, but they can charge for the support, and also for any documentation which they themselves have written.

If this were not the case, you wouldn't be able to go to a bookstore and buy books on using Unix, Turbo/Borland C, AutoCad, and the myriad other commercial products for which 3rd-party people write and sell books.

If Lexicor has been telling people that they are not obligated to send you a shareware fee *in addition to* any money paid to Lexicor, then they are making a mistake (although I'm not sure they are breaking any laws even if they are doing so; spreading misinformation is generally not a crime).

>All of the above effectively do the same thing, start a new copy of the
>shell program giving it arguments.

If memory serves me right: the dLibs implementation of system() / spawn() did check for _shell_p...

But for effiency reasons there should exist a way to be able to call a certain shell without spawning a new program. Otherwise we will end up with all kinds of programs who has a (too) small shell emulation builtin (like make).

This could be implemented by using a trap to call the _shell_p procedure. This will avoid race conditions between deletion of the shell and calling him. Of course this shell should be reenterable (Is any shell supporting _shell_p reenterable?)

Hi Roger!

You wrote:

SR>ut then I have found, 3 so far of German Patch programs for TOS 2.06, so
SR>what gives, what are all these patches for...???

SR>TP206V31.LZH, SOS_206.LZH and GIB_DOS.LZH are the 3 files in question,

I have heard only about GIB_DOS. This is not a serious patch, but only a joke. It replaces some lines in the desktop info boy with the statement: "Gib DOS keine Chance!" (engl.: "Don't give DOS a chance!"). So you won't have to worry about that one, at least (unless you like it, of course :-)).

I'm sorry that I can't give you more information than this, but I hope it helps a bit.

Regards,
Andreas

>_shell_p is fine as long as you can guarantee that the code you are calling
>is going to be there, but under a multitasking environment this is not the
>case. The program wishing to call a shell may have been sent into the
>background and the shell exitted.

But if the shell has been written even correctly it will have cleared the
_shell_p system-variable thereby saying there's no shell anymore. Shell's
should also do this in a single-tasking environment.
You should
check _shell_p EVERY time to see if it's NULL. If so don't jump through it.
This way you could only get into trouble if the shell disappears between
the time you check against NULL and the time you jump through the vector, but
the chance of that is quite small.

>>Am I wrong here? Or, if not, which mechanisms should be used for
>>calling a shell under MiNT/MTOS?

>(1) Use the system() system call.

What system-call is that? system() is call in the ANSI-C library and it`
probably jumps to _shell_p.

>(2) Use fork() and exec() to run a new shell.
>(3) Use a spawnv() varient to run a shell.

Will only work under MiNT and will cost you some memory but these methods
are probably the safest and the most elegant ones.

Ta! Vince

2737. Dropping icons in windows in MTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-11 09:43:58 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1993May11.104358@cs.bham.ac.uk>
Source record: 38684

Hi!
Can it be done? I think it's certainly something that's needed in a multi-tasking system. When I tried it on one of my windows it replied "You can't drop icons on that window!" which makes me wonder if you can set a new window flag to allow icon drop events? Or am I dreaming?

The current solution I have is a .PRG which accepts files and appl_writes a message event to the .ACC which then handles the input.

There must be a beter way though. If not, it's something that needs to be done quickly!

David.

This is ridiculous - Atari UK should provide MultiTOS with the Falcon just like Atari US are doing. Where's Works ? Where's SpeedoGDOS ? It's all very well to say HiSoft is selling the bloody things at 50 quid a throw, but I've already shelled out a small fortune on a machine that came with less than I got with my original ST in 1986 (at least I got a TV cable with that, the Falcon had bollock all, it didn't even have a plug on it [isn't that illegal here in the UK?]).

Do Atari think that they'll sell many machines like that ? Chinny rek on.....

MultiTOS stinks anyway - it's far to slow. I'm going back to TOSWIN, at least that didn't eat my 4 Meg Falcon for lunch by the time I had one shell going & leave me without enough memory to use GNU C++ at all.

I may become more cheerful once I've got Falcon NVDI.

BTW - If Markus Gutschke is reading this, respect where respects due........

ws> to install the overscan, and then found out that the parts shown in
ws> the diagrams, don't seem to exist!
ws>
ws> The diagrams are for a revision F STM motherboard, I have a revision
ws> D STFM motherboard.

Well, given that both of us have the same revision motherboard, and I
successfully installed overscan on this machine (and then removed it and
sold it to a friend - no use on a BBS 8) you shouldn't have any trouble at
all.

ws> Will the overscan go into a machine with a Rev' D, STFM board? If so,
ws> is the 'modulator' the RF-Modulator? In which case, where on earth are
ws> the pins for it, as the thing is encased inside a metal box, and then
ws> has a small board soldered below that....

There are more modulator styles than you can poke a stick at, but basically
all of them fit inside the rectangle printed on the silkscreen. At the
bottom of that rectangle is a row of holes (10 of them from memory), which
are where the pins would/could/might go.

ws> I also can't seem to locate the appropriate chips & resistors etc.
ws> (It says there is a L26 resistor to the right of an MFP 68901 chip,
ws> which doesn't exist on this board (none have that serial # printed on
it),

The 68901 most certainly does exist on your board, the ST wouldn't work
without it. On the right-hand side at the back, it's the long rectangular
one with 48 pins on it.

ws> and further to the right is a C16-resistor, which is beside the MMU
ws> (which I'm not sure of which-chip it is anyway, as the only square
chips
ws> (the MMU in the pic' is square, not rectangle), are 2 near the bottom
ws> of the board (One I presume is the processor).

No, the two PLCC devices are the MMU (nearest the front) and GLUE. The CPU
is the monster rectangular device over on the far right, near the mouse-plug
holes.

ws> Can anyone out there give me any help at all? As 640*200 is getting
ws> me down! :)
ws>
ws> Anyone successfully put O-scan into an STFM? How & Where!?

Yup. With a soldering iron, here in adelaide 8)

ws> E-Mail replies would probably be best to save bandwidth!

Hmm. But then again if I've goofed I'd like some feedback...

Here in Germany, all early Falcon customers can get their MTOS for free (directly
from Atari Germany).

Speedo and MultiTOS are already available here via Compo, which handles
the distribution for the rest of Europe. Prices are slightly higher
here, about 40 pounds each.
For Atari this is an experiment, and if this works out, other atari
software might be distributed the same way.
I think this is a good thing, since Compo and HiSoft have much better
marketing skills than Atari so users will benefit.

Erlend.

There is a drag/drop protocol for MTOS already. Take a look into the
AES4.0 documentation.

The problem is, that it seems a little like a one way street to me, because
the desktop can drop icons in your windows, but not the other way round, at
the moment.

|Hi,
|
|today I have this little sort of techie question for you Atari -Gurus.
|Short and simple:
|What has happened when I get to see mouse droppings? That is, when
|something in screen updating goes wrong. Sometimes the wrong
|mouse-pointer surroundings are displayed when redrawn. I suspect it
|comes from a program that did not exit cleanly, or it could be that my
|desktop program (Teradesk 1.24) has a bug or was damaged by some
|program that ran.
|If I know the source of the problem, I can maybe write a small program
|that fixes this when this has happened, and also prevent this sort of
|things happening when someone has run applications written by me.
|
|Any help or explanations are appreciated.
|Sys desc.: TOS 1.4 (UK) 2.5 Mb ram , 1040 STF and Megafile 60.
|

Generally, this problem occurs when the number 'hide_mouse' calls
(don't know the name exactly; there are two) and 'show_mouse'
calls do not match, or when they do not alternate.
There exists a program that *sometimes* fixes the problem when
it has happened; it is called something like 'm_recvr'.

Falcons only come with MTOS and Speedo IF you purchased the machine with
a hard-drive. Non-HD owners still have to buy it seperately.

Yes, you can drag icons to windows. If the program that owns the window
accepts the icons (i.e. understands the drag and drop protocol) then
everything is fine. If not, you get the "You can't drop icons on that window"
alert.

See the MultiTOS developer's documentation for a complete description of
the drag and drop protocol.

I believe that Atari UK will be providing MultiTOS with the Falcon,
and that the separate MultiTOS package is intended for ST and TT owners
who wish to buy MultiTOS. (It is true that some early Falcons were shipped
without MultiTOS; I don't know what the different Atari subsidiary
policies are about upgrading owners of these earlier Falcons.)

In article <C6vAKJ.Lr1@news.rich.bnr.ca> grier@bnr.ca (Brian Grier) writes:
>Falcons only come with MTOS and Speedo IF you purchased the machine with
>a hard-drive. Non-HD owners still have to buy it seperately.

I'm quite certain that this isn't true. We put a lot of effort into getting
MultiTOS working on a floppy-only system so that it could be shipped
with Falcons that don't have hard drives. I don't know about Speedo,
though; it's certainly true that it's virtually useless without a hard
drive. (Not that MultiTOS is all that useful without a hard drive, either,
but marketing is marketing...)

Disclaimer: I work for Atari, but I do *not* speak for them. Also, I
have particular knowledge of the policies of the various Atari subsidiaries,
including Atari U.S. The above are my opinions only.

2749. Recovering files -- summary

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-11 17:01:37 UTC
From: zimmermk@westford.ccur.com
Message-ID: <1993May11.170137.16094@westford.ccur.com>
Source record: 38594
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

This is the promised summary of responses to my appeal for help recovering
a deleted file. Thanks to all who replied! As I've noted, I wound up using
the sector dumper in TOOLS18 to find my data and the sector manager in
DFSUITE2 to copy the sectors first to memory and thence to a file. TOOLS18
is a nice package, and contains a sector editor; I'd been thinking that I'd
have to edit the FAT with this. DFSUITE2 is almost completely undocumented,
takes sector numbers in DECIMAL, and has unexplained options, but was sufficient
to copy the sectors off of the disk. Considering the alternatives, I don't
think that I can recommend DFSUITE2.

See if you can find a program called 'Salvage' which will let you tell
the computer the start & end sectors of the data on the disk which it
will then turn into a file!

(Should be on the FTP sites or local BBS's!)

Subject: Deleted files

Hi,
just because you mentioned to need it TODAY...
I did what you described one day, at least i tried and tried
until i gave up on it. I remember that the FAT entries are
encoded in some way, like a 2/3 encoding w/ bit swapping or
such ugly things. There is a book existing on the internals
of the ST, a friend of mine had it that time. But enough of
the so
story: i do _not exactly_ have what you need.
One idea: as the file and FAT format are equivalent to these
of DOS, maybe you can try on a DOS PC...
Next idea: You already found your data in the sectors: this is
a great progress! (are there several copies of old versions of
the file? This point broke my neck in the past). couldn't you
just write the sectors out to single small files with your
disk-monitoring program? Then cat them together.
Third and fourth: i was just at the ftp-server atari.archive.umich.edu
(dont know if you know what it is, but:) here are two small

packages. the names sound like "undelete", might be useful.
I appended the uuencoded archives at the end of the mail. They are
separated by a few empty lines and a "-------" line.

So i say "Good luck!" and

Greetins from Munich, Bavaria!

Walter.

Hello from Singapore,

I normally used DISKDOCTOR program to peek into the disk or hard
disk and if the directory track still intact I simply use SEARCH
function to serch for PRG so it will go to the location where all
files are listed. The deleted files will have their first letter of the
file name replaced by E5. By replacing E% with the letter (any alphabet)
will make that file reappear on the directory.

Now in the case that catalog tracks of FAT is corrupted. There are 2
programs that I know of that can deal with the problem.

1. CHKDISK.PRG by Atari Corp has option to use FAT1 or FAT2 or to
replace FAT1 with info from FAT2. If you only corrupted the usual FAT1
then you may be in luck. This program als0 good for defracmenting the
hard disk. I think that you can find this program in the atari.archive.
It will not allow you to reconstruct the FAT though.

2. Knift ST is a commercial program but It was given away as a COVER DISK
by ST Format magazine last year. Article on how to construct the FAT also
explained in the Magazine. I have the magazine at home so I can not tell
you what issue it is now. I never have to go to the extend to
re-construct the FAT manually yet but from what I glance through the
article it is quite complicate.

Another article in ST USER (or is it also ST Format?) explained the method
of constructing FAT by keying in the begining of the file, file length,
etc using any disk inspection program (eg. DISKDOCTOR, STDOCTOR, etc) but
again I never want to try out so far.

Another program called "HDSENTRY" (Hard disk Sentry) is a utility for
hard disk but it also work with diskette. It will rectify the invalid
directory and sub directory and create new file name for you. I might
produce numerous files by the name of FIX XX.XXX then You can used Word
processor to edit and join them into correct file (if it is a Data files)

AAnother method is to put the disk into IBM computer and use PCTOOLS or
Norton Utilities to work on the disk.

I all cases do not work on original "Corrupted" disk but copy the whole
disk onto a new disk using copy program. Some time you might have to use
the copy program which can set to copy 'protected disk' to ensure that all
the error track will be on the new disk as well as that particular track
might contain some relevant data need for recovering.
the caase of DATA)) pisn used then 0xxx . severmame nmcdal" ssik '

Hope this is of some help helps,

From: Patrick BETREMIEUX <bpat@binkley.cs.mcgill.ca>
Subject: Re: Need help recovering deleted file!
Newsgroups: comp.sys.atari.st.tech
Organization: School of Computer Science, McGill University

A cluster is a group of sectors. On the ST, a cluster is 2 sectors.
Each FAT table entry is the cluster number of the next cluster in the
file, or FFF if it's the last one. Each entry is 12 bits long, which
makes for a weird format. Especially since they are written in Intel
format. Thus, for each 2 entries in the FAT (i.e 3 bytes), we get that
"12 34 56" decodes to clusters 412 and 563.
If you know which sectors to put together and in which order, the task
is relatively simple if you take care not to make mistakes (Better spend
5 minutes on a calculation and be sure of the result than to trash things.)
However, fear not. If you indeed make a mistake that you cannot undo (You
don't know what the previous value was for instance), then you can always
get the 2nd FAT (Located 4 sectors after the first) and copy it over.
Now, here is a sample session on recovering a file with:

track 30, sectors 3-4
track 30, sectors 9
track 31, sectors 1
track 32, sectors 5-6

First, find out how many sectors per track your disk has. It's 9 if you
formatted it with the desktop.

Find out which is the first data sector of the disk. Usually, it's the 19th.
(So track 2, sector 1 if you have 9 sectors/track).

Group the sectors you want 2 by 2. So we get:
track 30, sectors 3 & 4
track 30, sector 9 + tr 31, sect 1
track 32, sectors 5 & 6
For each, calculate it's absolute sector number in the following way:
[track #] * [sect/track] + [1st sector of cluster - 1]
Then get their cluster number:

([abs sector #] - 18) / 2 + 2
As you can see, you may have clusters going through the boundary of a track.
This gives us for our example :
129, 132 & 139
In the FAt, count 1.5 bytes per entry, starting at 0.
Get your clusters number in 12 bits HEX.
081, 084 & 08B
When you find where an entry goes, write THE NEXT CLUSTER'S NUMBER in this spot. Not itself. Thus, at cluster 081's position , write 084.
But take care to swap the bits around. If the cluster number is even, write the number 123 as 23 X1 XX (X stays as they are). If it's odd, write it as XX 3X 12. The last cluster gets FFF.
Thus, at offset 193, we write XX 4X 08,
at offset 198, 8B X0 XX
at offset 208, XX FX FF
And then use you program to create a file from this, or if you know the format of a directory entry, create it yourself.

Good luck.

Patrick.

First, keep that disk you have the deleted materials on undisturbed. If you write over it, you can't recover the material.

Simon Poole has a program named DLII_024 that does exactly this. I've used it over the last 7 years and it works fine. It's an all-purpose disk utility. It is on most of the ftp sites.

> I said:
> There's a bug in Lattice C's STDARG.H...

Ooops. My mistake. If I had bothered to even glance at the ANSI standard I'd've seen that 'behavior is undefined' in terms of using va_arg() to access parameters which are subject to widening in the absence of a prototype. (IE, char, short, and float types.)

So it isn't correct to say that Lattice C is buggy in this respect, only that it doesn't work because it doesn't have to. (I was thrown off by the fact that every other compiler I've used, MSDOS and ST, works okay when you use va_arg() to get at char/short types.)

Anyway, the little fix I posted does work, and is valid; it brings LC into line with other compilers by ensuring predictable behavior in an area that's technically undefined.

Message-ID: <1spk54$r4b@usenet.INS.CWRU.Edu>
Source record: 38602

While installing TOS 2.06 in our user groups 1040 STe, I noticed two locations on the the mother board which are marked for a crystal and a number of resistors and capacitors, but the components are not installed. One area is on the left side of the mother board about halfway back while the other one is at the back on the motherboard on the right hand side near the DMA, serial and printer ports. These areas are marked for crystals Y100 and Y101 respectively. Can anyone tell me what the intended purpoase of these components was and why they were not installed"? Also what is the function of the E0 thru E7 jumper pads near the TOS ROM's?

2755. Connecting VGA monitor to ST

Newsgroup: comp.sys.atari.st.tech

Actualy, I have found a similar problem (i think) when trying to link my first assembly prog to my C prog. I needed to pass 'short's to the assembler routine via the stack, so I made a .h file for the C compiler with my commands listed something like this:-

```
void N_set_xy(short,short);
etc
```

...but, when it compiles it puts longs onto the stack?

Using Default int is short remedies this, but why???

>things happening when someone has run applications written by me.
>

I believe the problem is caused by a mismatching number of show/hide mouse
pointer calls using graf_mouse. If there are too many show mouse calls, you
will get 'mouse droppings' and if there are too many hide mouse calls, the
mouse pointer will disappear, but will still activate menus, highlight icons,
etc. (It's just more difficult with an invisible mouse - try finding cancel
buttons on dialog boxes :-).

There is a desk accessory called 'mouse recover' that fixes the problem by
allowing you to show or hide the mouse pointer. You can find it in
volume13/mousercv of a comp.binaries.atari.st archive.

Our local dealer brought his falcon to demo at the MFACC users group meeting in Orlando this past weekend. He ran programs and demos, both with and without multiTOS.

The falcon ran fine with all programs (works, lines demo, talking clock, a couple of graphics demos downloaded from Genie), and MTOS ran fine while running works, lines, and talking clock all at the same time. MTOS does seem to be a bit memory hungry, but it does tell you politely if it cannot load any more apps into memory.

The desktop ran at acceptable speeds, except in its True Color mode... but who needs more than 16 colors for the desktop in the first place???

My disk magazine construction kit, ST-ZINE, is now on Atari Archive. It
works on any Atari ST/STE up to TOS1.62 (update for further TOS versions
to follow this summer), colour or mono, any disk drive, any ram.

To get this utility in uuencoded .zoo format, send a note to:
<atari@atari.archive.umich.edu>
with the first line of the message reading:
send Magazines/stzine.zoo
The file is about 120k long.

This utility allows you to create disk magazines consisting of text, picture
slideshows (mono and colour) and tracker music (colour users only). No
programming knowledge is required; all you need is a wordprocessor.

The manual is provided in the form of an example disk magazine. Double click
on SHELL_33.PRG to run.

ST-ZINE is shareware and costs 5 UK pounds plus a disk and SAE to register,
but special offers exist for overseas users to avoid currency-changing
problems. See the manual for details. There are currently over 30 registered
users in the UK, mostly user groups and special interest clubs.

Please download ST-ZINE to PD libraries and indeed everywhere. Comments about
this utility are welcomed by email.

2765. ST Equipment and Software for Sale

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-12 13:36:24 UTC
From: ric@microware.com
Message-ID: <1993May12.133624.19537@microware.com>
Source record: 38621
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Netlanders,

I have the following for sale:

Price Item
----- ----
$75 SM124 Monochrome Monitor
$275 Spectre GCR w/ROMs and version 3.0 of software
$400 80 Meg SH204 Hard Disk

$20 Diamond Back II (works with GEM and GCR parititions)
$50 Laser C and Debugger
$50 PageStream (2.1)
$20 Lemmings
$20 Falcon and Mission Disk

$15 Atari ST Application Programming by Pollack & Weber
This out-of-print book provided me with excellent information on
programming the ST.

I also have a dead (maybe just power supply problem) 520ST with an Aerco
2 Meg upgrade (total 2.5 Meg), ICD AdSpeed 16MHz Accelerator, and TOS
1.4. I would accept offers for this.

SPECIAL OFFER: A free software program with docs with any purchase. I'll
throw in something I bought while owning my ST for free.

All prices do NOT include shipping. I will ship COD or after payment has
been received.

ricy@microware.com

Since I am a lowly non-commercial developer, and I have not paid for the Falcon AES documents, does the protocol allow an icon from one application to be dropped onto a window for another application?

I realize the sending application would be responsible for formatting the message.

2768. Megafile 30 problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-12 15:34:53 UTC
From: bayerr@glas.rtsg.mot.com
Message-ID: <1993May12.153453.309@glas.rtsg.mot.com>
Source record: 38615

My Megafile 30 has had booting problems right from the beginning. It would often make funny noises when it was switched on (like it was seeking outside the normal head movement area, moving the head against some obstacle).

The Atari (an 8 year old 1040ST) couldn't access the hard this then.

This would happen several times, I had to switch it off and on again.

Eventually, it would make the normal boot noises and would come up.

The computer then had no problems accessing the data, and it behaved normally.

It doesn't matter whether I park the heads before switching the disk off or not, the problem occurs by now almost everytime I try to switch on the hard disk.

Has anyone else seen this problem? Any ideas, or pointers what I could do about it?

Thanks,

2769. Setscreen question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-12 15:35:34 UTC
From: randyh@sad.hp.com
Message-ID: <C6x7BB.6w1@srgenprp.sr.hp.com>
Source record: 38612

Could someone explain to me how Setscreen works? Are Logbase and Physbase used with it? What I want to do is write VDI to a second screen and then copy it to the real screen. This is for a Xll game port I am attempting. X11 draws to a pixmap and then copies the pixmap to a window.

Thanks,
Randy Hosler

2770. TOS 1.2 ROM image

Well, I am finally bidding adeiu to my trusty Atari 520-ST. Since I sold my SpectreGCR (A TOP-NOTCH product by the way). It mostly collects dust, and I am returningnit to its owner who long-term loaned it to me. Anyhow, I have an ST emulator for my Amiga, but it will not operater without the 1.2 TOS image. Being out of touch with the ST world for a year and a half now (since I got a short-term job with Commadore, and then started my own video consulting business) so I don't know if any newer versions have come out, making 1.2 no longer attainable, and as I recall, 1.2 was never released on disk. Any one have some ideas that could help me out? And please no flames about becoming an Amiga user, I am really a multi-platform kind of guy, and that's why I still want the ability to access some of my Atari applications.
Respond via e-mail please.

Thank you...
Bill Mills

2771. Screen Rez On F030

Newsgroup: comp.sys.atari.st.tech

From: neurom@u.washington.edu
Message-ID: <1srbkcINNdbl@news.u.washington.edu>
Source record: 38614

Has anybody figured out a way to get programs that want ST resolutions to run in a window on the F030 640x480x256 screen? Perhaps tricking the App into thinking it's where it should be, then just placing it in one of those TOS windows? (No, I don't have one [YET!], but I've been reading things...)

Just a thought.

It would be interesting to run all those old hacky 320x200x16col programs
in their own virtual screens, then BLIT that screen periodically to a desktop
window...

In Holland it's stated policy to ship them only with HD machines. I don't like that. Buying a machine without HD doesn't mean you'll be running a floppy based system, it might mean you already have a HD. It 's quite clear that Atari doesn't give s**t about users with ST periferals, but setting them back an extra $120 or so for not throwing out the old stuff is a bit rude.

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
Ive got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you cant say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

>The problem is, that it seems a little like a one way street to me, because
>the desktop can drop icons in your windows, but not the other way round, at
>the moment.

Yes. We should take a look at the Gemini protokoll where --if I'm right--
you can ask info about a window. Of course, when an icon is dragged ONTO
a window of the desktop, it is still the other application that should do
something, not the desktop. One solution could be that the body of the drag
and drop message is four bytes that point to an address where the receiving
application can store a pointer to the path that is connected to that window.

So:

Application: Send drag and drop to desktop.

Desktop returns possible type of data it can receive: PPTR
('path pointer')

Application: Send a reference to a char* and close the pipe.

Desktop writes pointer to the path of the file window into the
char*

Obviously this needs improvement, because the char* is not ensured to remain
valid for long enough.

2782. Does AC_CLOSE clear resources?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-13 12:20:48 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <1stef0$7np@rw8.urc.tue.nl>
Source record: 38630

Hi,

while writing the incredible Extend-O-Clock program, I have come across
some problems. TO ensure compatibility with non MultiTOS systems it
will have to run as an accesory and program.
The problem is that I can only open the accesory once. If I try it
another time, no window will open (well it will, but won't be visible,
because of zero size).
I think I have found the problem. That is, if the acc gets an AC_CLOSE
message, resources might be cleared from memory.
Is this indeed the case? And do I have to reload the resource if the
acc is opened again? And do I still need to do a rsrc-free() call then
when I get an AC_CLOSE message?
And do accs have their own environment? So that I do not need to know
the loading path but can just load it form the dir it was started in.

Any hints and tips are appreciated, be it in e-mail or on the net.

Erlend.

2783. Calling AES (& VDI) From Assembly

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-13 12:48:32 UTC
From: glens@natinst.com
Message-ID: <1stg30$sgq@falcon.natinst.com>
Source record: 38631

I am writing in assembly and calling the AES & VDI. In the GEM Programming Volume 1: VDI it says that the calling convention is to put the address of the parameter block in D0.l and the magic number (I think either $73 or $C8) in D1.w then do a trap #2. In my Abacus ST GEM Programmers Reference it says to put the address of the parameter block in D1.l and the magic number in D0.w. Which one is right or is there somewhere else in the Atari developers documentation that I could find the right answer? (note that the method described in the Abacus book seems to work fine and I have not tried the method in the Atari docs)

Thanks.

```

The important one is minixfs.doc - this is required to be part of
any distribution of minixfs, which wasn't the case with the MDK.

If anyone has an ftp-able copy of the kit, and it isn't mirrored
from a.a.u.e, please copy the new docs (the only one that's changed
is the addition of minixfs.doc) or you'll be in breach of copyright.

Simon.

>It would be interesting to run all those old hacky 320x200x16col programs
>in their own virtual screens, then BLIT that screen periodically to a
>window...

Interesting. But not especially feasible. I'm trying to picture the program that could virtualize, oh say... Cyber Paint, into a window. Not bloody likely; Cyp has its little fingers into half the hardware chips on the machine. I think that'll be true of many older programs, especially those that run in ST Low rez. Virtualize the hblank interupts that it uses to change the palette on the fly? I don't think so. Virtualize the way it watches the mouse and paints the mouse pointer itself using logic that prevents the video beam from ever intersecting the mouse pointer? I don't think so. Virtualize the way it keeps changing the screen rez and pointers from ST Low to the Rez that it was started from, as it interacts with the user? That oughta be tricky.

Atari has always recommended resolution-independant programs that use only VDI services. These programs don't need virutualizing, they're well-behaved already. Unfortunately, users have always demanded more than a developer can deliver by following the guidelines religiously, and for certain types of programs, this will always be the case.

> Spectrum 512 on F030

I rather doubt it'll work, but I can't say for sure.

I do know one thing, though: any program that uses hblank interupts to change the palette on the fly doesn't work well in 320x200 on a VGA monitor. In that rez, the "line doubling" feature is used to keep the VGA monitor happy: each line of video is sent to the monitor twice, so the monitor thinks it's doing a 400-line mode. Atari, in their wisdom (ahem!) decided that the hblank interupt should happen *in the middle* of the pair of lines. That is, the first physical line is sent the monitor, then the hblank interupt occurrs, then the duplicate line is sent to the monitor. This means that any program attempt to change the palette on the fly using the hblank interupt is going to find the colors changing while the duplicate line is being painted. This results in some pretty ugly color flashing on the screen. I can't find a workaround for it, either. You can't just use a delay loop, because things are happening way faster than any clock you have access to at that point. You could try a CPU loop, but that doesn't work well because the state of the onchip caches affects the timing of any counting loops. (Not to mention the general messines of counting loops, and their tendancy to fail on new systems with faster/different hardware, and so on.)

>I don't suppose Spectrum 512 works on the Falcon?

Probably not (ditto with Photochrome) - I believe they rely too much
on the timing of the system to produce their pictures properly
(for instance, I need to switch to 8mhz on my MSTE to view them)...

>Running that
>in something like 640*480 mode would be quite impressive!
>(Running it in 320*200 looks pretty good, 4096 colors in 640*480 would
>be more than satisfactory for any graphics I'd want to look at!)

Well, you figure that GIF pictures use only *256* colors total
(from various sized-palettes) - a 640x480x256 mode (typical VGA these
days, as well as Falcon) would suffice for viewing most GIF pictures.
(higher resolutions would be helpful for those larger pictures).
With pictures greater than 8-bit color (JPG and TARGA for example) then you
would either have to view them in True Color mode for the best
color reproduction, or someone would have to come up with something
to maybe run under the 640x480x256 mode and get extra colors using the
techniques that SPC/Pchrome/Spof(?) to achieve their extra colors...

>be more than satisfactory for any graphics I'd want to look at!)

Well that's a neat idea, but I just have one question for you : _why_ would
you want to run Spectrum 512 on the Falcon? There are 256 color anmd 65536
color graphics modes in resolutions way higher than that of a Spectrum
picture, without having to do a weird palette-switching thing.
Spectrum is great if you just have an ST (although now there's PhotoChrome
as well -- downright amazing), but there's no need for it on the Falcon.

>Eventually, it would make the normal boot noises and would come up.

My my, doesn't it look like a thermal problem! It seems you hard
disk has a weak solder somewhere, causing a bad contact when it's cold.
After a moment, it warms up, the dilated metal creates a contact,
and the problem goes away. Is that close to what you observe?

If yes, I'd recommend to check the disk controller, or maybe the
DMA/ASCI card.

Try to turn on your hard disk 5-10 minutes before your ST, and
if the access problem does not show up, then the culprit is indeed
a bad solder in your hard disk. Now if it still appears, said culprit
is probably the DMA chip/soldering in your ST (which is still cold).

Hope it helps.

>when I get an AC_CLOSE message?

It was my understanging that an accessory could not really use rsrc_load().

Simple solution: load the RSC file yourself.

There is code in GEM++ 1.5b to do this - feel free to copy and hack it -
I scraped it out of a collection of other files myself (see file header).

Better still, just use GEM++ - then you can do stuff like this:

```
#include <gem++.h>
#include <foo.h>
#include <foo_oth.h>
#include <foo_gem.h>

main
{
GEMrsc resource("foo.rsc",8,16);
GEMrsc other_resource("foo_oth.rsc",8,16);
GEMrsc gumby_gem_resource("foo_gem.rsc");

GEMform a_form(other_resource,FOOFORM);
GEMform b_form(resource,BARFORM);

a_form.Do();
b_form.Do();
}
```

>No. There's no card for the STE (yet).

Sorry, but it definitely IS possible to hook this card into an STE, but a
DIL 68000 will be needed. Just use an adaptor PLCC->DIL. These adaptors
exist, a friend of mine has a Turbo16 (DIL) inside his STE.

Note: it may be that there is not enough space inside the STE case, though...

Sound like the problem I had. There are two capacitors in the power supply
(fat, standing ones and marked C15 and C16 if I remember corrctly) that are
on the light side. When I replaced them by ones with double the capacity ,
so advised by Atari, the problem disappeared.

Wrong. Whenever you get the AC_CLOSE message, AES has wind_deleted your window.
You will have to create a new one!

There is another BIG problem with this kind of protocoll: under MiNT we have
now memory protection (at least on 68030 machines), so it is not so easy to
access someone elses memory; and when we get virtual memory, we can forget
completly those pointers, as they are no longer valid in another processes
context.
As far as I know does the drag & drop protocoll by atari the following:
the sender opens a pipe and sends an drag&drop request to the reciever,
which contains the name of the pipe; so the reciever can open the pipe and
try to communicate with the sender. This way there are absolutly no problems
with memory protection and virtual memory adresses.
Maybe atari decides to make the protocoll specs public accessible, so that
everybody knows exactly how to do it.

Can someone please give a quick overview of how drag'n'drop is implemented? I think most of us are ingenious enough that if you said it was a combination of adding a new bit to the window attribute and then getting new GEM messages, we could work it out!

Is that what it is?

I know that, and that any memory that was allocated is freed (I don't use any mallocs in the acc.) But do resources also get wiped out? That is the question. The initial resource loading goes very well and the first opening of the acc also works now, but after having been closed re-opening fails. I do already create the window again, but the window size is determined from the size of the object in the resource and the resource gets messed up in some way, so the window gets zero size and is not displayed.

Hi,

Having received no replies to the original message, I rechecked to find
an error in the headers. Here it is again with apologies who may have
unsuccessfully replied before.

I have been asked this question by a friend who has a MegaST. If you can help,
please reply by email so I may summarize for him (and for anyone else who asks).

The question is simply....

Are there extended handles for the Bcon* calls for using the extra
serial ports found on a MegaST? If so, what are they.

Thanks,
John

Ok, I think I know how Setscreen() works. Found an old example.
It looks like Physbase() returns the address of the physical (duh)
screen. And I guess Logbase returns the address of the logical once
it's been created/reserved/malloc'd? The example I have uses a global
char buffer[32000] to reserve mem for the 2nd screen.

Here's what it looks like:

```
screen2 = (0xffff00 & (long)buffer) + 0x100;
```

My game starts but I only get flickering pixels on the last few scan lines
of the screen. Here is how I use Setscreen.

```
/* Get the address of the main. */
screen1 = Physbase();
/* Calculate the address of the 2nd screen. */
screen2 = (0xffff00 & (long)buffer) + 0x100;

****** this makes screen2 the logical screen, screen1 the physical.

which_scrn = 0;
Setscreen(screen2, screen1, -1);

****** now do my drawing and then swap the screens

/* draw some stuff to the logical screen */
...
...
/* update display: */
if (which_scrn == 0) {
Setscreen(screen1, screen2, -1);
which_scrn = 1;
}
else {
Setscreen(screen2, screen1, -1);
which_scrn = 0;
}

****** is this needed ?

Vsync();
```

Any help would be greatly appreciated.

Thanks, Randy Hosler

2807. Changing text/background colors?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-14 17:52:13 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1993May14.105215.4591@arizona.edu>

> interfacing C and assembler, sizeof(int) is 32bit, asm function is
> prototyped as (short, short), but it puts longs on the stack.

Yeah, the compiler is doing the right thing. While it isn't absolutely required by the ANSI standard, it is typical for a char or short argument to be widened to sizeof(int) before being placed on the stack. Some machines require this for proper stack alignment, some run faster when the stack stays aligned, and some don't require it but the compilers do it anyway. GNU C is in the latter category, and so is Lattice C unless the -aw command line switch is used to force passing of args at the defined size. (Hmmm, maybe it can be said that GNU/LC are in the second category. A TT or Falcon may run faster if the stack stays longword aligned. I wouldn't bet on it though.)

> resources in ACC

If you're going to load a resource for an accessory, your rsrc_load()
call should be right after your appl_init(), before your menu_register().
This is about the only way to g'tee that the memory GEM allocates for the
rsc file will belong to the desktop and not to some other application. If
you wait until you get an AC_OPEN to do your rsrc_load(), the memory it
loads into might belong to anyone.

The only real drawback to using RSC files in an ACC is that they eat some
extra memory, and if the user switches resolutions, that memory disappears
forever, due to the way GEM handles rez changes.

All of this info, BTW, is for TOS 1.x versions. I haven't used an
rsrc_load() in an acc for a long long time, so I dunno how it behaves on
newer TOS versions.

>windows? (No, I don't have one [YET!], but I've been reading things...)

Those programs make a certain call (getrez? - I can't remember) that
I believe returns a 1,2, or 3, depending on which ST resolution you're
in. You'd have to have a patch/TSR program to either intercept the
call and return the value you want (i.e. return the ST HIGH number,
no matter which res you're in), or assuming that the number is in
some memory location, you'd maybe have to plug in your chosen number
into that location being accessed.

I think this is probably one of the reasons that Arcshell, for instance,
will not run under ST LOW (even in a MonSTEr'd 640x400 ST LOW) - it's
probably checking for the ST MODE rather than the screen size. On the
same set of logic, I would say typical GEM-based programs (Pagestream,
Gemini, Connect, etc) would probably check out screen SIZE rather than MODE...

I don't know about IBM and the US, but at NCR in Canada, I was able to
cross out parts of my contract that I didn't agree with. Specifically,
there was a clause that would've prevented me from working at my
profession for two years after stopping work for NCR. Personell had no
problem with that being stroked out.

You should discuss it with them though! It's not like anything to do
with the Atari platform could ever affect any of IBM's markets or
products...

Gemini can do this; it writes the path/filename represented by the icon
into the Console window. ex, I have a manpager.ttp icon my desktop; if
I drag it into the Console window, Gemini writes g:\bin\manpager.ttp on
the command-line.

Well i have a SUPRA 20 MEG DRIVE (Including box, and scsi adaptor) and i have taken out the 20 and put in a TOSHIBA MK 234 FB - I BUT the supra hd utilities though it recognizes the drive and controller it wont format it.. The drive utilities are v4.03

The problem seems to be that it tries to format larger then the drive is, The drive is 105meg and it says it can format it to 109.02 megs. It formats fine and then during the check there are 212,000 (well actually 212,xxx where i can't recall xxx) sectors and it formats fine until 207,000 then EVERY ONE is bad until it aborts.....

Can someone please help me as i really want to get this drive working (the drive was formated today by the guy who sold it and he said there were no bad sectors but he used an icd HA and software. The case i bought seperatly (and the Segate HA was in it.)

If would be grateful to any responces.....

2815. HSC v2.0 beta testers needed

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-15 01:41:18 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993May15.014118.29277@mnemosyne.cs.du.edu>
Source record: 38512

I need a few beta testers for Heat and Serve C v2.0. The main difference in 2.0 over prior releases is that it allows long external names -- up to 21 characters. It also includes a completely new MAKE utility.

The beta releases of HSC do NOT include the INSTALL program, so to be a tester, you should be a current HSC v1.x user who already has a basic HSC installation in place on your system. (The beta release will come as a .LZH file with subdirs, which you just unpack yourself. But you already have to have GEMENV if you're a desktop user.)

The other requirement is that you be able to receive huge UUEncoded mail. I expect that the beta distribution file will be in the neighborhood of 700k or so.

I'll take the first dozen or so folks that reply to this message via email. Thanks!

Message-ID: <C73352.LHo@freenet.carleton.ca>
Source record: 38518

Hi. I am running Laser C (Laser Shell V1.1) and recently upgraded my
TOS to 1.4. Now the system hangs whenever one of my C programs exits.
Even a simple "Hello World" program hangs. The programs also run correctly
from the desktop. Does anyone know anything about this?

I know I'm a little out of date on Laser C. I didn't get the upgrade
right away from the last notice they sent and that was the last I heard
from Megamax. They haven't responded to any of my letters.

I suppose I should also mention that I have an ICD host adapter with a
hard disk drive attached with a 60K disk cache and stuff like that. The
boot driver is v4.8.2. I don't know if this could affect anything or not.

If anyone can shed any light on this problem I would really appreciate
hearing from you. Developing programs has become a real pain.

> at NCR, I crossed out portions of my employment contract I didn't agree with

Boy, that was nice of them. In my last 9-5 type job, some years ago, AMS found out through the grapevine that I had an article published in Antic magazine while I was working there. The Big Boss called me on the carpet and pointed out that my contract said I couldn't publish anything, and I must never do it again. (They were concerned that proprietary things developed on their time might become the subejct of published books/articles.) I pointed out that it was an Atari-specific magazine, and I could hardly be publishing IBM-mainframe-specific company-related work in it, so obviously an exception was in order. He said there were no exceptions for any reason. So I quit, right there on the spot. (I was really lucky that I had just found out I had gotten a contract working for Jim Kent/Autodesk the prior day. I had been planning on quitting anyway, but it was fun letting him believe it was because he was such an ass.)

2822. Brainstorm DSP developments

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-16 08:22:19 UTC
From: 73110.713@CompuServe.COM
Message-ID: <930516081816_73110.713_FHG35-1@CompuServe.COM>
Source record: 38520
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This information about Brainstorm's DSP developments for the
Atari Falcon comes from a recent FAQ file in comp.graphics and
it reports that they are steadily improving their MPEG decoder.

Since they are getting over 10 frames per sec in the 320x200
16-bit color mode, I would guess that the Falcon is capable
of decoding at 30 frames/sec in a 16-bit color quarter-screen
window *with* high-quality stereo sound? Maybe we should all
chip in $20 to help Brainstorm out with their DSP software
developments....agreed?

III.7 | ATARI

From 72241.405@compuserve.com Tue Apr 13 17:56:15 1993
Date: 13 Apr 93 10:40:34 EDT
From: Brainstorm <72241.405@compuserve.com>

Bonjour!,

For technical points about our MPEG decoder: It's a SOFTWARE ONLY decoder,
currently running on any ATARI FALCON computers (not on the TT, because
it uses the MOTOROLA DSP56001).

Video output modes:

- B/W, using a 4x4 bayer dithering matrix.
- 4 greyscales, using a 4x4 bayer dithering matrix.
- 16 greyscales, using a 2x2 bayer dithering matrix.
- ATARI 15 bits true color (no dithering).
We have to write the 256 colors and the 24 bits true color modes.

Decoder's MPEG compatibility:

It currently only handles I Frames. We have found some MPEG files with P
and B frames, so it shouldn't a problem to implement P and B decompression.
We don't handle MPEG sound, because it's currently impossible to find MPEG
fileswith MPEG sound. The only card which seems to encode MPEG sound is
from Optibase, and I ask them to give us a MPEG file with sound, but there
were not very 'interested' in helping us...

Decoder speed:

It depends a lot of the MPEG file and display mode. Here are some benchmark
with 4 known MPEG files:

File Size (Bytes) Time (Frames/Sec) Video Mode

F16.MPG 94959 12.15 320x200, 4 Col. (TV)
F16.MPG 11.25 320x200, 16 Col. (TV)
F16.MPG 9.10 320x200, T.C. (TV)

MJACKSON.MPG 724567 13.82 320x200, 4 Col. (TV)
MJACKSON.MPG 13.19 320x200, 16 Col. (TV)
MJACKSON.MPG 10.40 320x200, T.C. (TV)

ROM.MPG 250937 9.25 320x200, 4 Col. (TV)
ROM.MPG 8.81 320x200, 16 Col. (TV)
ROM.MPG 8.02 320x200, T.C. (TV)

TAHITI.MPG 303547 11.87 320x200, 4 Col. (TV)
TAHITI.MPG 11.28 320x200, 16 Col. (TV)
TAHITI.MPG 9.45 320x200, T.C. (TV)

Decoder Size:

Currently, it's about 22Kb. P and B frames management shouldn't take more than 10Kb.

Next Changes:

1: Speed: We expect to be 2 Frames/Sec faster in true color mode, and 1 Frame/Sec faster in other modes.

2: P and B frames compatibility.

Decoder's Availability:

Brainstorm is a small company, dedicated in writing software. We don't want to sell the MPEG decoder by ourself. That's why we are currently looking for a company interested in buying and distributing it. So, I can't tell you when it will be available, and what will be it's price.

Brainstorm:
19 bis, rue de Cotte
75012 Paris FRANCE
tel +(331) 44670809
fax +(331) 44670811

We can be reached at:
- 72241.405@COMPUSERVE.COM
or, maybe,
- laurent.chemla@f200.n320.z2.fidonet ??? (we didn't test it)

Date: 29 Apr 93 10:50:06 EDT
From: Brainstorm <72241.405@compuserve.com>

Brainstorm MPEG changes:

Things are moving a lot! Last days, we have been working on speed improvements on our MPEG decoder. Here are the new benchmarks:

File Size (Bytes) Av. Time (Frames/Sec) Video Mode

BIRDISBA.MPG 502473 15.24 320x200, 4 Col. (TV)
BIRDISBA.MPG 14.75 320x200, 16 Col. (TV)
BIRDISBA.MPG 11.51 320x200, T.C. (TV)

[stuff deleted]

The decoder is now 32 Kb.

As you can see, the speed depends a lot of the screen resolution. There are two main reasons:

1 - The Falcon video chip is connected to the MC68030 bus. It means that the video ram can be everywhere on the falcon RAM (on a PC, the video ram is on the video card). So, if you are using your computer on a nice video mode (i.e. true color), a lot of bus bandwidth is used by the video chip, and the 68030 is slower.

2 - In true color mode, the MPEG movie is displayed in color, and we perform 6 8x8 DCTs, and the colorspace conversion. In greyscale mode, we only perform 4 8x8 DCTs, and there is no colorspace conversion (we use the Y channel).

One of our biggest problem in this decoder is that the Falcon is a '2 chips' computer: the MC68030 at 16 MHz, and the DSP56001 at 32 MHz. We are using both chips (the MC68030 for the Huffman decoder, the DSP56001 for everything else). The speed of the decoder is the speed of the slowest chip. Till last week, the slowest was the MC68030, but we have improved a lot the Huffman decoder. So, the bottleneck is now the DSP56001. Our next big job is the DSP code improvement.

Best regards, Raphael (Brainstorm)

2823. Falcon demos

Lexicor is taking orders for these graphics cards at the end of
this month. It looks like a lot of Atari owners will be able
to rejuvenate their systems with the Nova! (Anyone in Europe
have experience with the it?)

<==>
LEXICOR SOFTWARE PRESENTS:

The NOVA Graphics Card.
<====================================>
Hi

It's me again Yat Siu from Lexicor Software Europe. I have a happy
announcement to make!

Lexicor Software is glad to announce that they have acquired distribution
rights to the NOVA Card. The Nova Card comes in essentially 5 different
versions. Lexicor Software Products that run on the NOVA Card are:

XENOMORPH-3D/PHOENIX (works 100%) all functions

Cyber Colour (works 100%) all functions

Prism Paint (works 100%) v.1.1, 1.5 and the soon to be released 2.0

CHRONOS-3D Newest Version (works 100%) You can even RENDER in any rez at 8bit

GENESIS (works 100%)

Render 24 (works 100%)

Utility Disk (?) I haven't checked all the utilities but nearly ALL
appear to work.

And since it has an own VDI Driver, most Atari Applications that are
written cleanly should work just fine. Now to the availability and the
prices, Lexicor users get a special price as I understand and for those
who buy our Software bundled, they too will get a special price. I have
listed them into Lexicor and Non Lexicor and listed the price respectively
below. I hope the formatting works now! :)

Type of NOVA Card Prices:LEXICOR User Prices:NON-LEXICOR
Description of CARD:

NOVA Mega 32K 300 U$D 360 U$D

32,768 Colors for
any Mega ST BUS

Nova Mega 16M 400 U$D 490 U$D

16,7 Million Colors
for your Mega ST BUS

Nova VME 32K 429 U$D 560 U$D

32,768 Colors for any
Mega STE or TT VME

Nova VME 16M 529 U$D 699 U$D

16,7 Million Colors for
any Mega STE or TT VME

Super NOVA 999 U$D 1199 U$D

Excellence and brilliance!
Requires a VME Bus Mega STE or TT

If you own an ST or a regular STE (eg.1040, 520) then with a special adaptor you can connect the Mega BUS versions on your ST, STE. Price of the adaptor however is to date not known.

Transport is not included, add another 30-40 dollars depending on how quick you wish to have a delivery.

Prices are Subject to possible change but unlikely.

To the specs of the Card now:
All the NOVA Cards, 16M, 32k VME or Mega BUS have this in common:

1.Max Pixeltakt: 90 Mhz

2.Video RAM 1 Megabyte

3.Ramtype DRAM

4.Have Virtual Resolutions

5.Automatic Rez Switch

6.Upgrade Possibility

7.VDI for its Colors (16M have 24bit VDI, 32k have 32K VDI)

8.All have a Videomode Generator

9.All go upto 1024*768 in 72Hz in 2/16/256 Colors

The Max rez in 16,7 Million colors for the 16M VME is 640*480 and the MegaBUS is 640*400.

The Max rez for BUS version is 1024*768 and for VME version is 1088*832 at 70 Hz.

The Max rez at 32k colors for BUS version is 768*512 and VME version is 800*600.

The SUPERNOVA is a dream Card for a dream Price!!!

Max Mhz is 135 MHZ with 16,7 Million colors at 800*600, 32k colors at 1024* 768, Absolute Max at 256 Colors max is 1280 * 1024. Ram type is VRAM unlike the NOVA standard DRAM and has 2 Megabytes of VRAM. It has everything that regular NOVA's have AND has a hardware speedup, making it even quicker!

Naturally, Virtual Resolutions possible!

This is a very, very fine card and is to my knowledge the cheapest available Graphics Card for your Atari. The Crazy Dots which we so promoted before is still a fine card, but proved to be less compatible than the NOVA making for Lexicor Software the NOVA Card be the preferred choice.

Please, as this is a service of Lexicor Europe which needs to import and may run out of stock, consider a maximum delivery time of 6 weeks, depending on your preferred choice of delivery (Ground, Air, UPS or FEDEX?!).

We will have stock, and it should not take so long....I am only being careful! :)

Yat Siu

From: Lee Seiler

Just a few additional comments,

In addition: as a special gift to all our Lexicor software customers Lexicor will be offering a "NOVA-Chronos Private-Stock" bundle which will include all updates for all Lexicor products which run on the NOVA. With the NOVA you can do complete animations from start to finish. This offer will extend to the Phoenix with a special NOVA Phoenix/.ANM update when it is ready.

This offer means that for as little as $529 (plus shipping etc.) you can upgrade your ST/TT system and begin creating full 24 bit animations. It is a plug and play combination you can't beat at any price any were else.

If you want to ensure full compatability of you existing or new Phase-4 software be sure to check here before making a decision on purchasing a graphics card.

For those of you wondering what drives the Nova cards, these are PC Clown cards with an interface card to the Atari (I spoke to tms about this on CeBIT). The SuperNova thingie is in reality an ATI Graphics Ultra card. Go check out a Clown reseller for the approximate performance of these cards.

Ain't that right, Doc?

I just tried the monSTEr big screen emulator, and liked seeing Cubase operate in the new virtual space.. Is it possible to actually use a Monoterm or other large screen monitor on a 1040 STE, or is this reserved for Mega's only?

2827. sound and hertz and novice's question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-16 23:26:48 UTC
From: zand0741@ee.uwm.edu
Message-ID: <1t6ijoINNank@uwm.edu>
Source record: 38527

Hello all,

I've read the three FAQ's, excuse me if I missed this one.
Could someone explain or point me in the right direction about the
Hertz frequency thingamajig about monitors? Specifically, if I run
software written from another country must I alter the frequency my
monitor runs at? I've heard that in America they run at 60Hrtz as
apposed to 50Hrtz in Europe, or something like that. The reason I
ask is that a shareware game program I have from Europe is well
written except for the sound which just doesn't sound right (very
course and metallic) I don't think anything is wrong with my ST or
Atari SC1224 monitor. Any comments? Help?

Thanks,
Douglas Zander

Hmm, interesting...

How good is the VDI that they've developed?

I'll be damned. I should have thought of that. Blasted memory protection...
Well, then we'll have to Fcreate some shared memory, won't we? And all this
to drop a few files on a desktop window... Maybe stick to the VA protocol
instead? We'll just have to wait for multi-gemini to come out...

A previous writer (thanks!) gave a hint at the solution. I've done some work on it and so maybe with a concerted effort we can work it out ourselves:

1. User drops icon onto window.

2. Window recieves GEM Message 63 (0x3F). msg[7]'s high byte-low byte combination will be ASCII 'AB' or something similar.

3. By now there is a pipe called 'U:\PIPE\DRAGDROP.AB' (note A B!).

4. Pipe exists for .5 seconds when alert appears on screen and operation gets aborted.

But I can't get stuff out of the pipe by fopen (the C call not GEMDOS) and fgetchar(h)-ing from it. It's just empty. Do you have to reply to the Message 63?

Come on, we can work this out! Note that miniwin.app copes with it!

Good luck!

David.

From: h54118@sakura.kudpc.kyoto-u.ac.jp
Message-ID: <h54118.737642455@sakura>
Source record: 38537

Hi there--

received my brandnew Mega STE4 from Germany yesterday.
Plugged it, switched it on and - NOTHING.
Not with 110 V, not with 220 V (I used a transformer).

So I took out the powersupply and found:
With 110 V the fan spins discontinuously, the DC outputs
are also not constant. With 220 V the fan spins more
continuously but still the outputs are impulses.
According to the technical specs. printed on the
powersupply it should take 100 to 240 V, 50 to 60 Hz so I
guess, the powersupply is broken. Do you agree? Or am I
just stupid?

Any hint, also on user contacts or workshops wich can
repair Atari are highly welcome.

If you want to make a very unhappy man a little less
unhappy, mail any idea to:

2835. Falcon Video Registers

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-17 13:23:24 UTC
From: mdg@ukc.ac.uk
Message-ID: <7245@falcon.ukc.ac.uk>
Source record: 38536
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some falcon hardware registers....

```
-------+-----+-------------------------------------------+----------
###############Falcon030 VIDEL Video Controller ###########
-------+-----+-------------------------------------------+----------
$FF8210|word |VWRAP |R/W (F030)
$FF8266|word |SPSHIFT |R/W (F030)
$FF8282|word |HHT |R/W (F030)
$FF8284|word |HBB |R/W (F030)
$FF8286|word |HBE |R/W (F030)
$FF8288|word |HDB |R/W (F030)
$FF828A|word |HDE |R/W (F030)
$FF828C|word |HSS |R/W (F030)
$FF828E|word |HFS |R/W (F030)
$FF8290|word |HEE |R/W (F030)
$FF82A2|word |VFT |R/W (F030)
$FF82A4|word |VBB |R/W (F030)
$FF82A6|word |VBE |R/W (F030)
$FF82A8|word |VDB |R/W (F030)
$FF82AA|word |VDE |R/W (F030)
$FF82AC|word |VSS |R/W (F030)
$FF82C0|word |VCO |R/W (F030)
```

This is SPOOKY, these register names are almost identical to the register names
in the Archimedes VIDC video controller, so is VIDEL made by VLSI???
So here are some possible register meanings :

HBB - Horizontal Border Begin
HBE - Horizontal Border End
HDB - Horizontal Display Begin
HDE - Horizontal Border End

VBB - Vertical Border Begin
VBE - Vertical Border End
VDB - Vertical Display Begin
VDE - Vertical Border End
VCO - Control Register(??)

Which basically means the Falcon VIDEL video controller is VERY flexible.

Griff.

>
> When I begin work at IBM developement, I will have to sign a
> contract unconditionally giving then all of my intellectual property.

First comment is that all contracts are negotiable. No matter who you deal with in life, they'll always try to shove a piece of paper in front of your face and tell you that you have to sign it "as is" because it's the standard document. Bologna. The contract is a starting place, which lists everything they'd *like* to get. You need to strike out those things you're not willing to give, and add those additional items you want.

> I'm afraid that I will not be permitted to do any IBM un-authorized
> programming.

This seems strange. I can't say with 100% certainty, but it seems to me that I've seen programs floating around the PC freeware/shareware arena that were contributed by IBM employees?

> Does anyone know how to copyright ideas for software before going to work for
> a large corporation. I don't want to make any money off of this software,

You can't copyright ideas.

> ...list of projects/ideas deleted...

> Is a statement like this to the UseNET a good enough copyright? I don't
> want to be unfair to IBM, but I would like to still work on these
> projects without having to worry about breaking the law. This is USA law.

No, but if you include this section as an addendum to the contract with the stipulation that it be incorporated by reference you will protect your interests.

As a side note, I can't predict how the particular division of IBM that you're dealing with will react to such revisions, but if I were an employer it would indicate to me that you had read the contract, considered its ramifications, and were attempting to deal in good faith (rather than just saying "yeah, sure" with no intention of complying). They, on the other hand, may attempt to browbeat you. Who knows?

I guess at this point I should mention that I am not an attorney, nor do I play one on TV. The above should not be construed as legal advice, simply a personal observation. If you want to be sure of yourself, you should consult with an attorney. Especially when you're dealing with

IBM (who has *lots* of attorneys).

> Does anyone know where I can get a copy of High Speed Pascal? How much
> does it cost?

High Speed Pascal lists for $170. Off the top of my head, Toad has it for $119, and Joppa for $114. If you have any other HiSoft or Oregon Research products, you should be getting a mailing from them (ORA) with a HSP special offer for $99.

It's an excellent package, and well worth the money for us die-hard Pascal programmers. I've been using it for over a year with good results. Andrzej Wrotniak has been saying nice things about it in Current Notes.

2839. getmode() register

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-17 19:26:42 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1336@usdtsg.DaytonOH.NCR.COM>
Source record: 38542

I'm not sure if I've got the right function, but I have a question
regarding the getmode(?) function (the function that returns either
a 1,2 or 3 depending on whether you're in ST Low, Medium, or Hi res).

My questions are

- how or where does the function get this number from?
- is there a particular hardware address that this number is
placed in (this I would doubt, considering all the different types
of ST hardware, etc)
- is there a global variable pointing to this value?
(in particular, is there a way to PUT a value into that
register/memory location?). Any help or sample code would
be appreciated. Thanks...

So far so good ...

>Here's what it looks like:
>
> screen2 = (0xffff00 & (long)buffer) + 0x100;
>

Oops, wait there ! If you reserve 32000 bytes, and you align them to 256
byte boundary, you go off your allocate space. Reserve 32256 bytes.
The flickering pixels are because the space you use as screen overlaps
slightly with what is located right after it.

>My game starts but I only get flickering pixels on the last few scan lines
>of the screen. Here is how I use Setscreen.
>

[code deleted ...]

Good ! well, at least, if it's not then that makes two of us ! ;-)

>****** is this needed ?
>
> Vsync();
>

Nope. Setscreen will set things up to be changed at the next VBL only (So
doing the equivalent of a Vsync for you)

Patrick.

2841. LK201 Keyboard

> guess, the powersupply is broken. Do you agree? Or am I
> just stupid?

I have two old sets of 1040STf+SM124, for US market, not for Japanese.
Both of them are working correctly without any transformers. I'm in Tokyo,
100V/50Hz area.

You might reach Atari Japan, because they seem to have an office, however,
it's almost impossible to get field service by ATARI dealers (hardly to find)
Seeking good music instrument shops may help you.

2843. XHDI specification, version 1.10

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-18 09:25:59 UTC
From: julian@math.uni-muenster.de
Message-ID: <1taa37$fp1@obelix.uni-muenster.de>
Source record: 38547

I just released version 1.10 of the XHDI specification (see below for details).
It's available from ftp.uni-muenster.de in public/atari/Docs/xhdi-110.zoo.
Currently, XHDI is supported by the harddisk drivers HDDRIVER and HuSHI, and
several tools (disk tools, virtual memory) and applications.

@(#)XHDI/intro.eng
@(#)Julian F. Reschke, 18. Mai 1993

The purpose of the XHDI (`eXtended HardDisk Interface') specification is
to enhance the communication with drivers for block oriented mass
storage media. We started with the thought to create a uniform interface
for some additional driver features. One goal was to create a standard
method for virtual memory systems to lock the eject button of Syquest
harddisk drives (you don't want the user to remove the cartridge with
the swap partition).

After further discussion, it was clear that the information available
via the PUN_INFO structure just wasn't enough and that the missing
information should be available with the help of this XHDI
specification. Reasons:

- the PUN_INFO structure only has room for 16 devices, but BIOS (and
some GEMDOS replacements) allow 32 devices

- it is impossible to install more than one AHDI compatible harddisk
driver in the system (there is only one PUN_INFO structure).

- Atari's definition of device numbers only works for drives with
Logical Unit Number 0.

For these reasons, the purpose of the XHDI specification (version 1.10) is:

- to provide more information about the installed devices

- to support new driver features like Stop/Start or Lock/Unlock.

The XHDI specification doesn't define new driver features -- it should
be easy to retrofit it into existing drivers.

For questions and suggestions, ask:

Ha! Obviously they seem to have found something ... anyone know what it is?
For what it's worth, there are a number of Works users here that have
already produced hundreds of pages of top-quality output with it - I asked
every single one 'has it broken yet?' and from every one I've had this look
of disgust as if to ask why was I asking such a stupid question. 'Of course
not' is all they have had to say on the matter. So, I'm curious. These are
people who refuse to use MSword or WordPerfect on the PC because it is too
unreliable. Their only complaint so far is the lack of style sheets or an
equivalent...

Umm, dunno if things are the same the other side of the pond, but here in
Oz, you'd be entitled to a replacement unit, rather than a fob-off repair
job if it failed that soon. Who did you buy it from? Why isn't it there
being fixed (or replaced) now?

For that matter, what reason do they give for not supplying Speedo and
Works?

j> No. There's no card for the STE (yet).

Okay - I faxed H&S a while ago and got no response at all (which
disappointed me quite a lot).

Can you (or anyone else) tell me which machines the IDE card(s) will fit in?
And if one purchases the card without the 2.06 roms does one still get the
software? (Obviously german 2.06 is not very useful here). There are quite
a number (>10) of people here that want the cards, as well as at least one
dealer who reckons he could sell quite a few of them.

2 solutions:

1) invert the colour palette from the control panel

2) modify the AES' text colours in a small DA or somesuch:

appl_init();
aesh = graf_handle(&j, &j, &j, &j);
vst_color(aesh, WHITE);
vsf_color(aesh, BLACK); /* This may not work the way you want */
appl_exit();

I thought that Setscreen only changed the pointers, but didn't actually
wait for the VBL... As a result, if you do the Setscreen but don't also
do a Vsync, you might be writing over some memory that you don't want to
be writing over (like the current screen memory) until the next VBL.

Maybe I've got this backwards... I think you need the Vsync, though.

I have a Seagate SCSI hard drive with a GE-Soft host adapter. When I switched it on the other day, it didn't make its usual power-on-self-test noises -- it seemed to get stuck and make "tock tock" noises instead.

I switched it off, let it spin down, and then switched it back on. Resetting the ST got a system that booted, but I got lots of messages about "Data on drive C: may be damaged" etc.

So, I ran the GE-Soft utilities, and it found a new bad sector in the partition that is Drive C:. I marked it as bad. Everything now worked properly.

Now, when I switch on the drive, it performs its power-on-self-test as before. However, right at the end, the "Access" LED comes on and stays on, and the ST does not boot. Resetting the ST twice will switch the LED off, and the system performs normally.

Does anyone know what's wrong, and if I can fix it?

As far as I know, it can't be done - the border screen is hard wired to
color 0. The only thing you can do is have an entirely black screen
with white text.

I think I got an upgrade to Laser C after TOS 1.4. At any rate, my version runs under TOS 1.4. Let me check the version number. When I got the upgrade and debugger, it took several phone calls leaving messages with some graphics company (no mention of Megamax in the answering machine message). The last phone call I left my address again and received my upgrade soon thereafter so I figured he had lost my address.

Outline is a stand alone vector graphics program, but as it only produces
CVG files, it is not a lot of use without Calamus.
BTW I have a Mega STE and have upgraded from Calamus 1.09n to Calamus S
and Calamus S is so slow even at 16 mhz that I have gone back to the
"old reliable" 1.09 !(just for info)

anyone want to buy a German language version of Calamus S? :-)

ICD utilties include a program called bootfix, which "programs Seagate and Quantum hard disks to reliably boot the first time". It is apparently a configuration that the hard disk stores in non-volatile memory. This may be related to your problem. Anyway, there are versions of the ICD software available via ftp (ftp.uni-kl.de might have it). The program is only run once, to initially program the drive. Give it a try, it couldn't hurt.

Also, the ICD formatter can be told to do multiple passes, which will usually root out any transient sector problems (which a single pass can miss).

hmmm, From the disassembled listing of the XBIOS, I have Setscreen() change the pointers, and then wait for _frclock (Address $466, it gets incremented by one at every VBL) to change (Saves it to D0, and then compares $466 with D0 until thy are different). I sure hope Atari hasn't changed this in the new TOS'es, because most (if not all) of my programs that do animations rely on this.

Patrick.

I thought Setscreen changed some vector in the lower regions (system variables)
and that the VBL code sees to it that it actually gets set in the video chip.
The videochip in early ST's didn't allow you to change the screen address on
the flow and they themselves only took the base address during a VBL so I
don't know how this doulbe buffering will work out.
Anyway, I don't think you need Vsync().

Your safest bet would be Setscreen() discussed in another thread.

It is indeed a stand-alone. It is quite powerful (and I gather there
is now a new, fancier version); but look also at Didot Lineart, which
I much prefer.

But can't I switch color 0 to black, then have the OS make the backgound color to something other than color 0, and the text color to something other than color 1? (BTW, it's TT-MED resolution that I'm really interested in--in ST high this can all be done easily using 'INVERT' on the control panel). (And I haven't got the previous suggestion to work yet....)

|> results.
|> sig deleted

Mmm, yes I would be inclined to say that myself, but don`t rule out everything. I have been using HSP for the past two years and it is good. But I had a project to code in pascal which eventually ran on the IBM PC. Now HSP is compatible with Borland Turbo Pas version 5. No higher than that. There was incredible amount of trouble recompiling in Turbo Pas. A large amount of code had to be changed. And before you say "Ah, but", there was no ST specific code.

About six months ago I found about Pure C. A Borland C package for the ST. Then I found at about PurePascal. Not written by Borland but by Application Systems Heidelberg. PurePascal has an environment similar to Turbo Pascal. It has trace and debugging facilities to a just mention a few features, plus watch and breakpoints. I was most impressed by the demo I found on ftp.uni-paderborn.de in something like atari/lang/pascal/purepasc.lzh I think.
But to come back to compatiblity, PurePascal is much more inline with Units and support code to Borland Turbo Pas 5.

So try out PurePascal first. I am not putting down HSP, I mean I still use it. But just only recently I wrote a Critical Path Modelling program for one of my math assignments. I had some trouble with pointers. PurePascal gave a lot of help in tracking most of the problems. A decent set of debugging facilities is imperative when you having problems with pointers.

Price and address

Application Systems Heidelberg
Software GmbH
Postfach 102646
6900 Heidelberg

The actual price is 398,- DM
(* Thanks to Andreas Niemeyer for the info *)
and according to Andreas there is apparently a special student price.

I haven't contacted Application Systems Heidelberg myself because I am
having to code in Modula-2 at the moment. (* Tons of work *)

In the sense that you _can_ import CVG format files into Pagestream,
Invision Elite etc. or change the CVG into an Illustrator EPS it is stand
alone... however you cannot print from Outline Art. I have Outline Art 3.0
with color and it is wonderful!!!

Sory Mike but from what I have seen of the Price for Didot, its not for the home user, its a real Professional program, and from the feed back that has come back to me Outline Art is not a stand alone program, plus you do realy need a TT and lots of Ram to run it, again still not a Home user program..

What I am after is a Program to replace the Bug ridden Pagestream 2.2, but I only need it for flyers etc...

Is there nothing out there for the Home user..??

2869. Atari Developpers Package + Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-19 22:13:23 UTC
From: kosmatoo@JSP.UMontreal.CA
Message-ID: <1993May19.221323.2319@cc.umontreal.ca>
Source record: 38572

Hi,

Today I called Atari Corp. and asked them how much the developper's
package costs, for non-commercial version, and Bill Rehbock himself
told me:

$150 for the developpers package + $20 shipping
$ 80 for the Falcon addendum + $ 5 shipping

I am a student with limited amounts of money and was wondering if
this thing is worth getting: (I.e. does it have all the information
one would ever need for programming the Falcon, including such things
as specific programming information for the various chips (registers,
pinouts), the ports of the machine, internal IDE port desc., etc)

It does not entitle me to ANY discount on the hardware, BTW.

Comments?

Should I simply wait until 3rd party english documentation comes out?

2870. Adding SCSI drive to existing setup

Hi People,

I have a TCT 106Mb drive comprising an ICD host adaptor and a SCSI
drive. The box has external DMA thruports, but no SCSI connectors.
I presume there would be SCSI connectors inside. Apparently the PSU
is man enough to handle an extra drive, so I'd like to do this. What's
the procedure? Is it possible?

Cheers,

Should be, if you have enough room in your case. If your internal SCSI ribbon cable only has one drive connector, you will need to get one with two drive connectors (three connectors in all). If you only have the one power connector, you will need to get a splitter. Then, plug everything together. Typically, the host adaptor will be on one end of the cable, one drive on the other end, and one drive in the middle. The middle drive should have its terminating resistor packs removed. Also, the two drives must be set to different SCSI IDs (usually via a bank of 3 jumpers). The drive you wish to boot from should have the lower SCSI ID.

The ICD manual covers the details of this process fairly well.

Someone please correct me if I'm wrong, but don't SCSI drives essentially
format themselves? The controller sends out a format command and the on-drive
controller does the rest.

If the errors are occurring when trying to partition the drive after low level
formatting, then try setting up partitions that don't go past 207,000 sectors.

Message-ID: <13472@uqcspe.cs.uq.oz.au>
Source record: 38581

partingt@fwi.uva.nl (Vincent Partington) writes:

>Anyway, I don't think you need Vsync().

Of COURSE you need a Vsync()! Look at it this way:

```
VBLANK# | Frame visible | Action
| A | Setscreen(...B...)
1 | A | Draw on screen A
| A | Setscreen(...A...)
| A | Draw on screen B
| A | Setscreen(...B...)
| A | Draw on screen A
2 | B | Setscreen(...A...)
| B | Draw on screen B
| B | Setscreen(...B...)
| B | Draw on screen A
| B | Setscreen(...A...)
3 | A | ...
```

Without the Vsync(), you'll be drawing all over the currently visible
screen - causing flicker, and completely defeating the double-buffering.

You don't HAVE to call Vsync() after Setscreen() - but if you don't
you aren't garaunteed that the screen you have asked to be displayed
IS being displayed immediately after the call to Setscreen() - OBVIOUSLY,
since the actual monitor display may be half-way through drawing some
old screen as you call Setscreen(), and Setscreen() does NOT wait for
vertical syncronization.

My thoughts exactly.

(It's supposed to includes documentation for the DSP and a debugger for it,
stuff like that.)

P.S. The falcon's not available in Quebec yet.

2878. Problem with my SM124 monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-20 04:32:25 UTC
From: allan@cs.UAlberta.CA
Message-ID: <allan.737872345@swanlake>
Source record: 38579

Hi there.

I have an Atari SM124 monochrome monitor, manufactured in 1985. (I have had the monitor since I bought the system new, about 5 years ago.)

Lately, I've noticed that the far right edge of the screen sometimes seems to be brighter than normal, and any characters at the edge are narrower. (Its almost like the scanline trace doesn't complete normally.)

It also seems that the entire screen becomes off centered to the right.

I usually use my ST for running Uniterm. (Thus, there are a lot of white, bright pixels.) I tend to notice this problem when its warm outside, although this could be coincidence. (It doesn't happen all the time.)

Does anyone know what the problem is, and how it might be corrected? (Or is more information needed.)

2879. Atari ST <=> Magnavox (Commodore) Monitor - part II

From: mgm@world.std.com
Message-ID: <C7B6Co.AnA@world.std.com>
Source record: 38580
Cross-posted to: comp.sys.atari.st.tech,sci.electronics

My friend is still trying to connect this monitor (Magnavox Professional, sold as a monitor for the Amiga) to his 520ST. Thanks to the help of some folks on the internet, we've been able to build the proper cable to hook it up.

The problem: We do get a picture, but there's a vertical roll - as if someone had tweaked the vert hold control. The picture is definitely there, but it moves...

The monitor exhibits no such problems when hooked to an Amiga or a Commodore 128 via their respective cables, and the ST works when hooked to an ST monitor.

Any idea what causes this? A slight timing variation? A loose/cold connection in the cable? Something hooked up wrong?

Thanks for any info. Mail replies preferred.

I don't know the price for Didot LineArt, because my copy, sort of, erm, fell
off eh... the back of a truck, but it definitely runs on an ST. I have an
1040ST with 3Mb RAM and I have never encountered memory problems. It can
render PostScript output, which OutlineArt can not. It does have a (very bad)
tracer and a very good fonteditor/converter. Now you can read PostScript Type1
fonts and convert them to Calamus CFN format.

It's not far more complicated! Read my later posting about pipes... Surely I can't be that far away from gettiong results? I just get the feeling that I should be sending DeskTop a message saying 'I'm ready for the info!'

Anyway, what's this talk of the Gemini protocol.. Don't we want to use the Atari one for MTOS?

2883. Hard Disk Adapters & Memory Boards

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-20 11:40:47 UTC
From: "Gerry O'Rourke"
Message-ID: <1993May20.114047.7412@bmers95.bnr.ca>
Source record: 38585

Someone recently posted some information regarding a memory board that would allow up to 12 Mbytes in an ST/E. This memory was supposed to be available for DMA/Video usage. When I tried to send mail for more info,it bounced. Could the original poster please post info or another address.

Also, has anyone ever built their own DMA to SCSI adapter?

Regards
Gerry

Hi Erik,

yes I do have a copy of Didot Line Art, but I think its a Demo version,
there is no printer option from what I can see of it, can yours print..??

Another good German program is LavaDraw Plus, can do a lot of thing with Text,
no big fonts from what I can find out, 3D mode and Stars with any number of
pionts, shadow text and yoy rtell it were the show will be, etc..

German software I find is good, but can't read German much..

Is there any other good programs that you know off..??

Bye for now...

Yes, Markus Gutschkes excellent Falcon HiRes driver (900*768*4bit) uses these registers to full effect, giving a competitive HiRes mode to a Falcon without extra hardware, which works fine for all falcon software....WHY did Atari not include this GFX mode as standard from the desktop??? The hardware can do it...

Unless Atari has changed, the dev package consists of a box full of photocopied docs (some apparently photocopied too many times) with no binders and in a fairly disorganized manner. It's all at the system level and most calls are described in assembly or sometimes C. It's very comprehensive, no doubt, but finding what you are looking for isn't easy. It's not very pretty, especially compared to the class act developer support docs you get from Apple, but it doesn't cost as much either.

The Falcon addendum is pretty skimpy, IMHO. Most of what you need will be in there, however. I'm surprised Atari is asking $80 for it, though!

There are still three tiers, I believe, of Atari developer status. The first tier is for hobbyists, the second is for commercial developers who are _not_ currently shipping a product, and the third is for commercial developers who _are_ currently shipping a product. First tier folks just buy the dev docs. Second and third tiers require a business plan and details of current and planned products. Third tier requires 3 copies of each product you ship for Atari's "library."

Used to be you had to buy the developer's documentation package as well but I'm not sure that rule still applies. Unlike most other manufacturers, Atari does not charge an annual developer license fee. But then again, the degree of physical support you actually get from Atari is minimalistic. While Bill Rehbock, Mike Fulton and John Townes (late of Atari) have frequently helped in the question and answer department, I've gotten much more actual usable support from the IAAD (Independent Association of Atari Developers). BTW, you must be a registered Atari developer to join the IAAD.Atari is simply no longer geared or funded (if they ever were) to provide massive developer support. It _is_ possible to get help, but you have to work at it. ;-)

Anyone interested in becoming a US commercial Atari developer should contact Bill Rehbock at Atari.

Hope this helps.

I know this subject has been discussed before, so please bear
with me.

Questions:

What is involved in connecting a multiscan (aka mulitsync) monitor to
a Mega ST?
What kind of adapter is needed?
Do only certain multiscan monitors work with the ST?
How is the change from monochrome to color resolutions handled?

Any help would be appreciated.

Source record: 38444

I must confess this really puzzles me. If Atari is doing as bad as is being said, how come they charge people who want to help them out ? I would feel that giving away photocopies of the doc along with all machines would hardly cost much (They can always get it done at any print shop for $0.03 a page, so 6 bucks for a 200-pages manual), and it would help people to get programs working. And those programs would be assured to be compatible with future computers/TOS versions, as all developpers would have full knowledge of how things are to be done. Also, the added software thus produced would entice more people to buy the machine, and so on ...

This may be real simplistic, but I'm quite sure it can't bring Atari to any worse position then it is now. They don't even have to be preciously bounded documents with glossy white paper. Just plain photocopies on recycled paper would be quite enough. Better that than nothing I'd say. Letting third parties make up affordable docs isn't so good, as they tend to forget or make mistakes (Take the GEM prog ref. from abacus. Nowwhere do they mention that to draw on the screen with the vrocpyform() function, you can pass 0 as address in the MFDB instead of getting it from Physbase(). Found out when looking at disassembled programs once)

I'm not speaking for myself here. I'm not going to buy a new computer, so even if Atari did follow such a plan, I couldn't take advantage of it. But isn't it kinda strange that you guys at Atari "Cannot reveal the drag/drop protocol" ?? What purpose could it serve not to make the information public ?

I'm sure (Or at least, I hope) that these decision were not made out of the blues by dice rolling or coin tossing, so maybe someone could enlighten me on the obscure motives behind this.

Patrick.

> Turbo Pas. A large amount of code had to be changed.

Hmmm, a large amount of code? I'm aware of a number of deviations from Turbo (no procedure parameters or constant expressions come to mind). But HSP never claimed to be anything more than v5.0 compatible. I'd say it reaches about 95% compatibility. What types of deviations did you encounter, and could you say a bit more about your troubles in recompiling for Turbo? I'd find it useful.

> Then I found at about PurePascal. Not written by Borland but by
> Application Systems Heidelberg. PurePascal has an environment similar to
> Turbo Pascal. It has trace and debugging facilities to a just mention
> a few features, plus watch and breakpoints.

Pure Pascal is available in the U.S. from Gribnif, at $275. It didn't occur to me to mention it, because John simply asked where he could get HighSpeed.

Pure Pascal does indeed look very good, with a number of powerful features. The source-level debugging/tracing facilities are especially nice. The environment did feel a little "odd" in comparison with others I've used (e.g. instead of a File menu with Open/Close/Save, etc. it has a desktop with drive icons you click to open windows of files). In some ways though, I'd say it's a bit *better* than Borland's.

> But to come back to compatibility, PurePascal is much more inline
> with Units and support code to Borland Turbo Pas 5.

Actually, I'd go farther than that. You left out its OOP extensions, and I'd say it's 98-99% compatible with Turbo *5.5*. But what do you mean when you say "more inline with Units"? HSP has exactly the same Unit capabilities.

> So try out PurePascal first. I am not putting down HSP, I mean I
> still use it.

Well, I don't know about trying it first. I'd say, after paying $275 for it I doubt you'll drop it for something else. On the other hand, if you meant to check out the demo (which I believe is on the Ann Arbor Atari archive), I would encourage that as well. HighSpeed can

be had for $120 or less, and is a smaller, fast package with very good documentation and online help system. The manuals for Pure Pascal and its help system, however, are all in German, which may be a minor impediment :-(for some U.S. programmers.

> PurePascal gave a lot of help in tracking most of the problems. A decent
> set of debugging facilities is imperative when you having problems with
> pointers.

I agree. And HighSpeed is weak in this area. There are advantages and disadvantages to both systems, so it's a bit of a toss up.

Unfortunately, there's no demo of HighSpeed available, so a direct comparison isn't possible. Once again, I'd refer people interested in HighSpeed to check out Andrzej Wrotniak's reviews in Current Notes magazine.

In any event, I fear I'm wasting my time here, since you, me, and John are about the only people in this group with any interest in Pascal. Too bad.

I'd agree with what John said, but would add that the docs Atari has
done more recently (say the last year or two) are *much* better in
both content and quality. Unfortunately, there's more of the old
stuff than the new stuff.

> The Falcon addendum is pretty skimpy, IMHO. Most of what you need will
> be in there, however. I'm surprised Atari is asking $80 for it, though!

Yeah, me too. Unless there's lots more than what I've got, $80 is
pretty extreme. Certainly *not* what Atari needs to be doing to
encourage software development on the new platform. The volume of
material I've seen could be circulated on the online services for
free. Maybe Atari is throwing in Motorola DSP manuals, or something.

> >Should I simply wait until 3rd party english documentation comes out?

At this resolution, what's the refresh rate? Also, would higher resolutions be possible in a monochrome (1-bit) mode? I'm thinking 19" monitor here (1024 x 768, or 1280 x 960).

I take it this is just software? No extra hardware involved?

It seems really strange that one can go out and buy an IDE controller
and a 100+ mb disk for under $300 for PC clones and yet Atari disks
are so expensive.

I know the drive itself is the same, so why is the controller so
expensive? Is there a propietary interface, or does it require special
features to be recognized correctly by the software? Does TOS interface
directly with the HD controller IC, or is there an intermediate interface?

Does someone sell just a drive controller board so I can just go out
and buy and IDE or SCSI drive? If not, why not?

Thanks!

Re: Atari charging for developer information...

Allen Pratt used to put it quite simply... Atari makes a profit on every developers' kit they sell, so why should they just give the info away..?

Companies like IBM, who sell OS/2 and its development kit for $15 on a CD-ROM are just missing the boat..

Sure they'll get a ton of OS/2 compatible software written by third party developers, but just think of all the nickles and dimes they'll be missing out on..

Atari charges "big bucks" for their documentation to weed out all you amateur computer weenies who just *think* you can write the world's next PONG... too bad IBM isn't as astute as Atari is. They'll never amount to anything...

(By the way.. why is this in the .tech group..? And remember.. *I* didn't start this here...)

In <1timlqINN2eu@golem.wcc.govt.nz>, sheppard_r@kosmos.wcc.govt.nz writes:

[> PLease Michel have a look at Steves Yelvingtons Ucoder program, I think what
[> you have done has put me off Ataries for life..

I sure hope so. That would really make me happy. In fact, I would be
ecstatic. First, since you are speaking directly to me, you should have
used electronic mail, instead of adding band-width to the entire network.

[> Your Decoder has NO FILE SECLECTOR, and why do we need 2 separate programs..

You really should try reading the documentation. It says, quite clearly,
that if you HOLD DOWN THE LEFT SHIFT KEY, you will be presented with a
file selector which allows you to choose an output filename instead of the
one contained in the UUEncoded file. Is this too hard for you or something?

You should never have to select an input file with UUDecode, since it is
meant to be installed as an application.

[> NOTE: TOS 1.0 and 1.2 don't have a real working install application,
[> you have to patch the desktop.inf file, also you don't have thought
[> for Disk only users...

TOS 1.0 & 1.2 & 1.4 will work fine with ESS UUDecode. That is why I did
not use a resource file. Even if they did not, though, you would have to
blame Atari, and not me.

[> If you intend to produce a GEM program, produce it, not a half baked
[> GEM TTP...

Precisely what have you written for the ST? Have you *ever* contributed
anything? ESS UUDecode does EXACTLY what I claimed it would. It provides
the user with INFORMATION while a file is being decoded. It does this
using a dialog box with a pleasent format, instead of text all over the
screen.

[>
[> Lets have some decent programing standards, this would be the worst
[> I have seen yet..

If you want decent programming standards, write your own programs and then
share them with us. Otherwise, go purchase an IBM or something so that we
do not have to listen to your ranting. If you dislike ESS UUDecode, do not
use it. What could be simpler? Even you should be able to manage it.

[> May be you need a trip to Germany...???

What? Perhaps I do, but what does that have anything to with programming?
That would be like my pointing out that you have almost no grasp of the
english language, or that your thoughts are only mildly coherent at best.

At CeBIT, 3K dumped the prices on the Didot package - it is now DM595 for the b/w version and DM995 for the colour version. This is a bundle that consists of Didot Lineart and Retouche Pro. The colour package of course includes the "CD" versions of the two packages. As I see it, they are lowering their prices since the developers left and formed H3 or Digital Arts or something. The new company are offering DA's Vector (and soon DA's Picture). Great app, cheap as well (DM 295 SRP, DM250 street - coming to the US soon) but not yet 100% MTOS friendly as far as I know.

For the home user - well you *could* still use EasyDraw with Speedo or some of the other GEM orientated drawing progs out there. X-Act Draw from germany for instance. That one will probably work just fine for flyers. More apps that tap into the power of the new GDOS will surely appear soon.

But pleeeeeease, dump that Pagestream shit *NOW* :-)

>Next, I will find out how they compare for speed..

I did not check this specific case, but generally speaking look up
tables are a lot faster than calculating the CRC every time you need
it. Of course, you can blunder and write a program with look up tables
that is as slow as a program without them, but this will rarely
happen. On the other hand, wasting 512 bytes of memory does not do
very much harm. Just check out, how much memory is wasted by constant
strings and GEM resource data; in comparision to that, a 512 byte
table is tiny. But you would probably not ask Atari to optimize the
size of their ROMs by removing the resource files :-)

Oh, the reason is very likely that Atari doesn't want complete newbies
come to the store saying "All I did was choosing 900*768*16colors mode
and now my monitor is broken". Some monitors can't handle this and will
be damaged. One of the monitors that could be damaged is Atari's own
PTC 14something VGA monitor. At least according to specifications. So
it was just some appropriate measure to prevent damage.

```
Hi all!

This is good news for all you C++ hackers out there:

- INPUT NAME MANGLING IN GDB36 -

It was built in the originals, they had just left in an annoying bug,
which led to an 'syntax error in expression' whenever one tried to
enter a demangled name. This problem is solved by the patch below.
I've also built in a few lines for convenience, so that one can see
where to put the breakpoint. These patches apply to the GDB36 sources
distrib on ftp.germany.eu.net, either version (pl1 and pl2) should
do.

P.s.: This bug fix was tested with G++ 2.3.3, I can't promise it works
with the 1.X.X versions. Try out and let me know...
I've mailed these to Andreas Schwab, too, so they should be
incorporated in later patchlevels. (If any...)

Have fun, Joe

When I ran into a similar problem I called Supra Tech support and they
told me that since my 20 Meg drive was an older model I was encountering
timing problems. It seem the adapter card in the drive box was not able
to respond fast enough to the newer SCSI disk I tried, a Conner CP3100.

You can send in your adapter card, not the whole drive, to Supra and get
it replaced with a newer faster card for a reasonable fee. At the time
(last year) it was about $50 and may be different now. You'll need to
call their Tech support line to get a Return Authorization number before
you send them your card.

GEE I did not think that a programer could make a mess of a program than
Michel Forget did..

This is his ESS ucoder decoder program..

PLease Michel have a look at Steves Yelvingtons Ucoder program, I think what
you have done has put me off Ataries for life..

Your Decoder has NO FILE SECLECTOR, and why do we need 2 separate programs..

NOTE: TOS 1.0 and 1.2 don't have a real working install application,
you have to patch the desktop.inf file, also you don't have thought
for Disk only users...

If you intend to produce a GEM program, produce it, not a half baked
GEM TTP...

Lets have some decent programing standards, this would be the worst
I have seen yet..

May be you need a trip to Germany...???

Long lives Steves Yelvingtons Decoder...Gee that does at least have a File
Selector..!!!!

If the Falcon can do 768x480x16 bit interlced this works out at a bandwidth of 2949120 bits for each full refresh... If I've worked this out right then you could easily have 1280x960x2 bits (4 colours). That would be lurvly on a 17 inch monitor but a bit of a mess on a 14inch VGA :).

Hmm. Okay, one of the things you must remember is that you must use a SCSI HD, which is more expensive than IDE anyway. Also, you have to make it external, meaning you have to get a case and power supply. Finally, you need a host adapter that turns the ACSI/DMA signal on the Atari to SCSI.

There are two major flavors of this concept now:
1) The older idea, make an interface card with an in and out DMA port, SCSI controller, and internal adapter. These you can get for about $75 new for the cheap ones. This allows you to hook up to seven SCSI devices together, and the thru port allows you to hook up another DMA device (BTW, possible to hook up more than one host adapter?).

2) The new idea, ICD's Link. It's an adapter that goes on the DMA port and comes out an external SCSI port. Done. Now all you have to do is buy a standalone SCSI unit, and you can chain any up together. Although, they're more expensive than taking 1), but Mac, Sun, HP, Unix et al users have been paying that for years.

The cheapest long run way to do it would be to:
1) Purchase a [used?] ICD Host Adapter from 1) above.
2) Get an old AT/XT case w/ power supply.
3) Run a cable from ST to host.
4) Get a SCSI cable w/ as many plugs on it as you want.
5) Start filling the case w/ drives.

You should be able, if you shop around, to finish steps 1-4 for less than $125. After that, all you need are the drive mechs.

Hope this helps.

I am using a BMS 100 and Adaptec 4000 to run my hard drives. I noticed in the book for the BMS 100 that it said only 64 Meg of a single drive would be supported, no matter how big the drive is. Is this a software or hardware limitation? If I use Supra Utilities instead of the software that came from BMS, could I use larger drives? Or do I need to upgrade to a BMS 200 (or possibily a different Adaptec) to use larger drives?

Also, when checking the partitions of my current drive, I noticed the software said that GEM only supports 16 Meg partitions adequately. Is this still true?

They are expensive because you have to get the cabinet, and power supply
in addition to the drive. SCSI drives are normally priced at $10-$20 higher
than their IDE counter-parts.

|>
|> I know the drive itself is the same, so why is the controller so

You have a proprietary interface, that does not have a large enough
demand to warrant a large production run to get the cost down.

|> Does someone sell just a drive controller board so I can just go out
|> and buy and IDE or SCSI drive? If not, why not?

You can buy an AdSCSI board and create your own HD setup but I would recommend
getting a SCSI drive, that can be set to disable parity, in a case, typically
a MAC hd will do, and get the ICD Link host adapter.

...

Just a little reality check here on prices. Yesterday, in one of the other news groups, people were drooling over Next's giveaway prices for their Intel developer's kit for Educational users, under $ 300 . The normal price is $ 2800 . And on the PC and MAC, just a single copy of WP or WORD costs as much as the entire ST developer support package !

Note also that any decent computer programming consultant charges at least $100/hour, and often more than twice that. A commercial developer could recover the cost of an $ 80 Falcon update by just not spending a half hour worrying about it ! Note that for continued full support from Atari you will actually produce a product. The cost of producing even one product dwarfs the very minimal cost of the Atari developer support. And indeed, as you suggest, there is a lot of free support on the networks, with working examples of almost every technique you might need to use. You should only purchase support from Atari if you need advanced information (advanced in time or depth) or marketing support.

Atari charges only a reasonable cost-of-production for their kits, and they certainly are not making a profit from the developer's fees. True, it does not cost much to Xerox some paper. But someone has to run the Xerox machine, copy the disks, pack and ship the boxes, prepare and ship the newsletters, etc.

Hey,
The Reality Engine is bitchen. Too bad we don't get to make high end boxes like that anymore. Anyway, to hook up a SCSI disk that you have at work to your ST you just need to buy an adapter board from ICD for about $100. I beleive they also have a cheaper verision without a clock for $80. Basically you supply +5V to the board and connect the DMA port to the input and out of the board comes the SCSI bus that you hook directly to your disk drive.

Keep in mind that the $80 or $100 bucks you spend for the board also goes toward the software drivers and formater that comes with the board. Most people will tell you that the code is really good (deals with any SCSI drive). Also, ICD includes a manual that explains how to build your own drive (not alot of detail but the basics are there). You also get a DMA cable.

Ted

(Happy ICD customer and nearly happy graphics hardware accelerator designer)

Toad computers (1-800-448-TOAD) sells multisync stuff for the ST, and they would know the specific answers to your questions. Also, I think there was an info text file on this subject on atari.archive (let me know if you can't find it, I may have it at home).

I am not sure about the BMS host adaptor, but ICD does not have this
limitation, and they claim that their software will run on other host adaptors
now (with caching disabled, unless you pay for it). You may want to check
on this (i.e. it may be a software thing).

> Also, when checking the partitions of my current drive, I noticed the

> still true?

TOS 1.0 and 1.2 had this limitation. For TOS 1.4 and above, it is 32mb per
partition. I am not sure about the Falcon/TT.

(Patrick BETREMIEUX) writes:
>said, how come they charge people who want to help them out ? I would feel
>that giving away photocopies of the doc along with all machines would hardly
>cost much (They can always get it done at any print shop for $0.03 a page, so
>6 bucks for a 200-pages manual)

FYI, the order form I received from Atari concerning developer docs
stated that there were over 1500 pages - that's $45.00 at your $0.03
per copy rate. Plus it includes 5 disks of development software. I
doubt that developer docs are a high profit product for Atari.

Regardless of what it costs, I'm tired of attitudes like "I bought
your computer, so now you should supply me developers docs for free".
If you want more, PAY FOR IT. Someone has to do the work, whether it
be developing the protocol, typing the rough through final drafts of
the documentation for that protocol, running the photocopier or
responding to requests for developer doc info. I don't work for free,
you don't work for free, so why do you expect someone else to?

Thanks for the comments, Mark. What is this about the OOP extensions in PurePascal? Are these the Turbo-compatible OOP extensions? If so, that would be great as I would like a Pascal package with that level of compatibility.

You also mentioned the documentation. That is one of the reasons I was wanting HSP at first, as opposed to PurePascal. Maybe there is a book someone could recommend that I could get as a companion to PurePascal?

I really think this question ought to start appearing in the FAQ.

The latest version of ICD's host utilities can be found on GEnie or
CompuServe, or on their own BBS (815/968-2229) These are proprietary
files and are not allowed to be posted at ftp sites or on BBSs.

All the HSC documentation comes with the single distribution file. The
INSTALL program creates a \SOZOBON\DOCS file containing all the docs. If
this is not the case with the distribution you got, then you don't have
The Genuine Thing. You can find the official release at a.a as
HSC140.LZH, but you might want to wait a week or so before getting it, as
version 2.0 will be ready by then.

> $ 80 for the Falcon addendum + $ 5 shipping

I'm sorry, this really belongs in .advocacy:

IBM is selling the OS/2 2.1 Professional Developer's Kit CD-ROM (full of
online documentation, C/C++, PL/1, etc, etc, etc for 650M worth of data,
including OS/2 2.1(March) beta) for:

$20 US + shipping (USA)
$30 Cdn + shipping (Canada)

Oh, and you'll actually get support from the company.

Atari should charge less for their development kit; it's not like people
will be able to make back the investment real quick. IBM's PDK CD-ROM
deal is _fantastic_ for students and people on a budget.

2928. Could a faulty DMA affect RAM-disks too?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-22 18:41:03 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993May22.184103.17230@prime.mdata.fi>
Source record: 38478

I have a STe with a faulty, HD-wrecking DMA chip. I however have no HD, but I use a large RAM disk instead, and I'd like to know whether or not the DMA chip could wreck my RAM disk too, if the RAM disk program uses the HD vectors to control reading/writing from/to the RAM disk? I ask this because every once in a while I find that my RAM disk appears (from the directory window) to be empty. When I try to use the Show Information option on it, the machine crashes with 2 bombs. Sometimes a folder in the RAM disk contains nothing but garbage filenames that consume a random number of bytes (usually very much), and sometimes a file contains a part of another file, eg. a textfile could contain at the beginning a part of some other file too. The length of the textfile in this case is not altered however.

Another question related to the file-contains-some-other-file's-data problem, could something like that be caused if some program that manipulates files forgets to close the file handle? I have a program that I use to add LF's to textfiles I download from the UNIX environment, because they only have carriage return. I have checked it and I don't think it should leave any handles unclosed..

Alright folks, I'm not saying this to start another achiver war, but I thought you should know this. I zip files all the time on this Un*x site (in fact I think it's real AT&T UNIX) and then uncompress them to a MINIX partition running under MiNT on my ST. If using the command line, I can ZIP files on my ST with STZIP and preserve the long filenames, and the GEM version will uncompress files using the long filenames (and preserve the long length) just fine. I found STZIP to compress better than ZOO and is much friendlier especially when using the GEM interface, which allows me to read over my C code without uncompressing it.

STZIP is also ALOT faster than ZOO, and is a bit faster than LZH. I've had alot of problems with ZOO archives either not uncompressing properly from bad headers or not creating or using sub-directories properly. I think perhaps we should stop using ZOO for the internet archives. Most files on a.a are ZOOed which uses more space, takes more time to de-compress and makes it harder for users to get at the information than if they were ZIPed. If your worried about long filenames or case sensitivity, most of those files do NOT need nor use either, since they are set up to extract on a stock ST, and as I've already said, STZIP handles it just fine.

As for not having the source code, well, ZIP is pretty popular, more so than ZOO on home computers, and the ATARI is a HOME computer, not a UNIX workstation I think too many people on this Net want UNIX workstations. Well, the ATARI isn't one.

>be missing out on..

Although OS2 is really cheap there are less OS2 products than Falcon
products. Hardly anything is available for OS2 2.0. So being
cheap is not the only thing that counts.

That's not true, at least for non-commercial developpers. So basically, they want about $250 U.S. for some docs. No hand-holding, no discount on hardware, no announcement of new products.

Ok, anyways, thanks to everyone who answered, I have decided that it is not worth getting the Developper's docs until some falcons show up in this country (Canada). :-)

i have repacked litereally hundreds of .lzh files as .zoo and scores of .zip files as .zoo. i have NEVER seen a difference in size by more than a couple of hundred bytes, regardless of archive size (the difference is in the file headers). i have also noted that all archivers i have used on the ST unpack with similar speed (within about 25-30%) so unless you spend hours a day unpacking files, saving 2 minutes a day is hardly worth what you loose (ie portability). packing is a somewhat different story. zoo 2.1 with "h" option is slower than (say) lharc. but not by more than 50-100%. again, if all you do is pack, then this is significant. if not, it is not worth the typing of this article to press your case.

so: compression size is NOT an issue since all these programs do about the same (in my experience with hundreds of archived files), and speed is a minor issue except to people that do nothing but pack and unpack archives. the major issue with archives is (long term) preservation of data across many systems (which includes your problems with long file names). since the native ST file system only supports 8+3, i suggest you use an archiver designed for long file names (ie tar and GNU zip). Minix is a relatively small special case (which even i, someone whom many would wrongly convict of being a "unix bigot", do not use). in this case, you'd want a version of zip (or unzip) or zoo or lharc that works on your unix host, then repack with tar and gzip it. zoo 2.1 on my unix system has preserved file names (length, case, and directories) without any problems. the entire GNU C distribution and updates come in .zoo archives, always in directories, and often with long and mixed case file names. again, i have never had a problem unpacking them on a unix system.

>As for not having the source code, well, ZIP is pretty popular, more so than
>ZOO on home computers, and the ATARI is a HOME computer, not a UNIX workstation
>I think too many people on this Net want UNIX workstations. Well, the ATARI
>isn't one.

first, comp.binaries.ibm.pc uses zoo 2.1 mostly. i read it daily so i think i know what gets posted there. and ibm pc is generally regarded as a "home computer" like the ST. it is no more a unix workstation than an ST, tho unix

does happen to run on them reasonably well. however, c.b.i.p contains programs which run under MS-DOS, not necessarily unix. i'll let u argue which "community" (PC or ST) carries more "weight". personnally, i don't run unix on my ST. nor do i use a Minix file system. plain old TOS (and MiNT, mostly so i can run a decent CLI). note that about 1 in 20 files posted to c.b.i.p are zip. the rest are zoo. there are generally few if any .lzh files posted. the amiga groups seem to be using lharc files now (they used to post shar files with uuencoded binaries to the net). i have no idea how they are archived, however. i do know that SIMTEL and other PC archives have mostly zoo files, though .zip files are also showing up (but then again, that's not necessarily usenet). i won't comment on the mac groups.

second, this has nothing to do with unix workstations. the fact is that usenet access for many if not most people is not via direct connections of ataris on the internet. it is by some other system, be it unix, VMS, or whatever. that said, accessing archived files generally means FTP or mail. once the file is gotten on some intermediate system, i for one usually unpack it to see if it is something i really want. without an extremely detailed (and updated) index on the archive server, you generally have only 2 choices to see if the file is what u want: unpack on the intermediate host (unix, or whatever) and read the docs, or download it blind to the ST and see what is in the file. at 2400 or even 9600 baud, this could take long periods of time, so i would imagine many people would want to forego this drastic alternative, no matter how good or fast the archivers are. you can always repack the archive in whatever format you desire on the intermediate system. however, you can only do this if you have good source code. and i have never had a single problem with the unix version of zoo 2.1 with dealing with either directories of file names. and virtually all zoo 2.1 archives are compatible with all versions of zoo 2.1 i know of. this is NOT the case with both zip and lharc (tho unzip 5.0 seems to handle the current crop ok while unzip 4.0 does not, and unix lha seems to be able to read all .lzh files i have gotten, though this was not always the case). i can't talk about how these programs work with Minix fs since i don't have one (i use 8+3).

finally, i have no intrinsic interest what archiver is used as long as i can unpack files on my particular intermediate host (currently a unix system). unfortunately, with lharc, the ST version is written in assembler (tho again, the C lha seems to work on all files i have found) and with zip, i am not sure of the general availability of source code (tho unix unzip 5.0 seems to work fine). of course, both of these programs have gone thru many stages of generating incompatible archives between versions. zoo is far more stable. i define "stable" as not changing file formats every other version. some may call this "not keeping up with technology". to me, being able to unpack something in a couple of years is far more important that how much space it takes up or how much time it takes to pack it.

no archiver that does not have more or less portable source code available that can run on intermediate systems should be considered as a "standard" archiver, regardless of how slick it's GEM interface is. if you can't unpack the file on something besides an ST, it is no good, IMHO.

if you really want a true standard, go with tar (defined by POSIX, the world's only portable operating system standard) and perhaps compress or GNU zip (the former a long-time de facto standard, and the former gaining as a replacement for compress). note that GNU zip is NOT zip in that it does not archive many files. it just compresses a single file (so far). otherwise, lharc, zoo, and zip are all about equally bad, tho at least zoo has source available universally. lharc and zip only have kludges and hackarounds (which so far work, but there is no guarantee that they will continue to do so). zoo is controlled by a single person. lharc definitely is not, and i'm not sure about how zip is managed.

i suspect that this debate has no universal solution, tho i would think that making a GEM front end for tar/gzip would be ideal for many reasons, at least the ones that are important to me...

Just have every archiver available that you can run on the machine, that way, you'll have no problems! (Much less anyway).

Just use whatever archiver suits you the best, and if the person at the other end complains because they aren't up to date, then it's hardly your fault!

++++++++++++++++++++++++++++++++

I don't think you're right. You can count the number of Falcon specific
products on one hand (wel, maybe two). I think there are some more OS2
2.0 applications.

I was wondering, what exactly is covered by NDA in the developer's docs?
I seem to remember Bill Rehbock saying something to the effect that
any pages stamped wiht the red "confidential" stamp was covered by NDA<
but that anything not stamped was freely available information.

Can someone clarify this? Bill, are you still out there!? .-)

From: steve@wan.inf.rl.ac.uk
Message-ID: <13597@hardy.rl.ac.uk>
Source record: 38343

In article 2m0@cville-srv.wam.umd.edu, cmedley@wam.umd.edu (FLiP) writes:
>I was wondering if anyone could email me the hardware addresses and
>registers on the ST's MIDI ACIA. I'm trying to see if I'm losing bytes
>by using the standard BIOS functions in a program I'm writing and I would
>like to hit the hardware directly so I can make sure it's the OS. :)

The info you want is

```
*
* Motorola MC6850 ACIA chip
*
MIDI_CTRL equ $FFFFFC04 ; midi ACIA control reister
MIDI_DATA equ $FFFFFC06 ; midi ACIA data register
midi_on equ $95 ; midi IRQ on code
midi_off equ $15 ; midi IRQ off code
```

BTW the MIDI lossage occurs because TOS routines (IKBD handler & 200Hz clock)
hog the processor at IPL6 for longer than the ~320us between MIDI bytes
causing an overrun on the MIDI ACIA.

The fixes are:
(1) Make the offending TOS routines interuptable and code your own MIDI
handler; This is non-trivial because the are mutually non-renterant. Also
the IKBD & MIDI ACIAs share the same interupt vector and even worse they
are level triggering devices ORed together fed into an edge triggered
device (the MFP) so they can lock each other out if you're not careful.

(2) Replace the MIDI, IKBD and TimerC routines completely. This is
non-trivial in itself. There is also the little matter of interfacing your
IKBD hander to GEM.

(3) Replace TOS/GEM (except for floppy/hard disk drivers). Non-trivial.

(4) Disable mouse & clock while recording. Messy.

I have seen all 4 approaches used in various commercial sequencers.
I used (1) in my PD effort but it has a weird problem with early STs.
I am gradually working on (3) for a pro sequencer.

> No wonder Atari is going down the tubes with Programers like that..

The look-up table method is much faster than the method that you're
probably using (you have to loop through the bits, right?), and remember,
TOS 2.06 ROMs offer a whopping 512 KB of space for tables, so that's
no problem at all. Case dismissed 8-)

What does TOS 2.06 use the CRC routine for?

*** NEW ZEALAND PRICES OF PC CLONES.... ***

Some one was after the prices of PC Clones here in New Zealand,
but Please note, are Dollar is about 54c US..

These are current prices from PC General...

Some of the features are..

1. Local Bus Windows Accelerator with 1 meg Ram..
2. 16 Million True Colours, Muti-Mode RAM DAC..
3. 2 VESA Local Bus 32 Bit Slots..
4. 4 megs of Ram..
5. 14" Mutisync Monitor 1024*768, Non-Interlaced, 30-60k 72hz..
6. Upgradable CPU to Pentium on 486 machines..
7. 1.4 meg Floppy..
8. 129 Key Keyboard..
9. Calculator..
10. DOS 6.0 and Windows 3.1 Installed..

Prices are in NZ Dollars..

	120m	210m	340m
I.D.E. HD..			
386DX-40	$2349	$2549	$2799
486DLC-33	$2499	$2699	$2949
486DX-33	$2899	$3099	$3349
486DX2-50	$3199	$3399	$3649
486DX2-66	$3499	$3699	$3949
EISA-66	$3849	$4049	$4299

So to get USA prices from these, please divide by 1.852

You have to add 12.5% Sales or Vat Tax..we call it G.S.T...

The estimated Flacon 4/65 price will be about $3000nz, with out Monitor,
including the 12.5% Tax..

So how do these prices stack up with the USA John..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

Hello,

If all goes well I will be buying a Falcon in the next few months, and
I would like a decent monitor to use with it. I know this has been discussed
before, but I have a few questions:

1) Can the ST compatible modes ie ST Low,Med,High be used with an SVGA
monitor, or do I need an sc1224 or multisync that will scan at 15khz
(I would like to run my old ST software)?

2) If I buy a multisync, is it worth getting one that does 15-40khz, or
should I not bother with 15khz and get one that does 30-60khz (bearing
in mind add-ons such as ScreenBlaster, graphics cards etc which will
provide greater resolutions)?

3) What is the chance that after buying an SVGA monitor, most programs
are written with TVs in mind and not VGA monitors. How dependent will
games and other software be on the screen mode and monitor being used?

4) Will programs like FalconScreen and super78 work on an SVGA monitor?

Thanks in advance for any answers,

Paul Donovan

|> monitor but a bit of a mess on a 14inch VGA :).
|>
|> Ian

The Falcon CAN do 1280x960x2bits with about 68Hz interlaced, but only with
additional hardware. Without hardware you'll get 44Hz interlaced :-<>
(flicker...). This is only possible in 4 colours and nowhere else ...
The better way is to use 1024x768x2bits with 103Hz interlaced (needs hardware).
I am working with 960x720x4 (16 colours, 93Hz interlaced) all the time (needs
hardware (BlowUP030), too). To say it simple, without extra hardware the best
you can get is not enough for your eyes (this has NOTHING to do with the number
of colour planes!)

Basically, everything is covered by NDA. If you see the information available elsewhere, you can repeat it. If you get information by some means other than one of the documents covered by NDA, then you can repeat it. Otherwise, you can't.

(This is the standard way that NDAs work in the computer industry.)

I've never seen a red "confidential" stamp on any developer docs. If they are starting to put one on, perhaps it's to serve as a reminder.

Developer discounts on hardware are OK when a new machine is first introduced
but after a couple of months most dealers can easily beat Atari's developer
pricing schedule. That's certainly the way it was when I bought my MSTE
through Atari. Atari's NDA prevents us from disclosing what their hardware
discounts are but believe me, it's not that much. Anything helps, though. :)

I don't know what the current ruling is, but I do know that Atari has always been very strict about non-disclosure. When I bought my dev pack ages ago, I seem to recall the NDA covered _everything_ in there that was published by Atari Corp (but obviously not the Motorola, etc, docs). Best to call Bill Rehbock directly and ask him. I don't believe Bill monitors the Internet although he _does_ respond to questions and email on GEnie.

Yes, as I recall (it's been almost 6 months since I played with it) it had full support for v5.5/6.0 OOP capabilities (object, constructor, destructor, virtual...). But I didn't actually try anything out, other than one simple example that came with the demo.

[I just checked Gribnif's last flyer, and confirmed that it does indeed have full OOP support.]

> You also mentioned the documentation. That is one of the reasons I was
> wanting HSP at first, as opposed to PurePascal. Maybe there is a book
> someone could recommend that I could get as a companion to PurePascal?

I can think of 2 options: buy an old Borland manual set for 5.5 or 6.0 from somebody who's upgraded, or get one of the 3rd party books on either version (usually around 2 inches thick!) floating around the bookstores. I remember several from McGraw-Hill/Borland. If you can still find a 5.5, they'll probably be blowing them out for $5.

One other nice thing about Pure Pascal that I failed to mention last time is that the environment supports an unlimited number of windows, on any version of TOS. It does this by completely replacing the GEM screen, i.e., you have to flip back to a GEM screen to be able to access any desk accessories.

I suspect that Pure Pascal is actually *slower* compiling than High-Speed. Nobody at Gribnif has ever been able to tell me how fast it is, except to say "even faster than Pure C", which runs 9,000 lpm. HighSpeed compiles 20,000 lpm.

One final comment for now is a personal (and subjective) observation. I don't think anybody at Gribnif really cares much about Pascal, which may affect the level of support offered. On the other hand, I've gotten very good responsiveness from Dave Nutkins at HiSoft on the HighSpeed system (on GEnie). I believe he can also be reached via an internet address as well. If you go direct to the German developers of Pure Pascal, they may do well too.

Any ST and NO STE.

I've done it in a 520ST+, now it's got an internal 20 meg 2.5" hard drive...

>And if one purchases the card without the 2.06 roms does one still get the
>software? (Obviously german 2.06 is not very useful here). There are quite
>a number (>10) of people here that want the cards, as well as at least one
>dealer who reckons he could sell quite a few of them.

You actually NEED TOS 2.06, since earlier versions don't support IDE drives.
(That's why ST Book machines have TOS 2.06...)
You'll have to get a TOS 2.06 from a local dealer to get the right language.

Formatting software is included, you'll need an AHDI 5.00 driver for operation.
Note that AHDI 6.03 does not work.

Multiscan and multisync ARE NOT the same. They are quite different.
Multiscan is the cheaper of the two, commonly found with crap PC monitors;
they are hardware-limited to a small number of fixed scan rates/resolutions.
Multisync is a trademark of NEC, and refers to a system that dynamically
adjusts to a wide range of different input scan rates/resolutions.

Anybody have any comments about the JRI memory expansion board (the one that takes SIMMS)? I am considering bumping my Mega2ST up to 4mb. I am a bit hesitant to modify my Mega, as I have never had any kind of problem with it (which prompts me to leave it alone). I am primarily interested in hearing if folks began to experience a higher incidence of weird lockups or crashes after installing the JRI upgrade.

Funny, I never felt cramped with 2mb until I began to play with Mac emulation . . .

Thanks in advance for any comments.

Funny, I thought I had! (I'm not complaining about free software, and
indeed, if I do not like software, I will not use, or pay for it!)

It looks good, but it's no good on my system! (If I had a hard-drive
it'd be great!)

>(I would like to run my old ST software)?

Yes. I use all 3 ST-compatible video modes on my Falcon and an SVGA monitor. That includes programs like Tempus and Cyber Paint which want to see 100%-compatible video modes because they touch screen memory and hardware in extrememly mode-specific ways. Never had a problem. (Of course, these same programs fail to run in the new Falcon modes. Well, Cyber Paint doesn't, it knows how to switch a Falcon to ST Low mode on the fly, but it works equally well on SVGA or TV type monitors.)

I've yet to find software that refuses to run in an ST-compatible mode on a Falcon with an SVGA monitor. (But I haven't tried boot-up-into games like Flight Simulator and stuff.) My SVGA monitor is a NEC 3D clone.

It fits into all ST machines (even the 260/520 ST if you remove the shielding).
Yes, getting the driver software has nothing to do with TOS 2.06 (which you will need if you want to autoboot from the IDE drive).

In Europe (no idea about US) there exist several solutions for connecting
an ST/STE/MEGA/MEGAST/TT/FALCON to ethernet. The hardware uses either the
ACSI(DMA) or the internal VME/MEGA slot. Pricing is from DM 1300 to DM 2000
(calculated from prices in Austria). :-(
You can choose from boards of the german companies RIEBL/WACKER, PAMs or
BIODATA. Software usually includes some sort of VT100 telnet.

We here at the University of Technology in Vienna developed our own
solution using a parallel-port to ethernet adaptor from D-Link (DE600 for
$ 300.- (sort of XIRCOM type if you know)) which works on all types of
ATARIs, connected to the cartridge(ROM)-port via some self-made adapter
(there are some lines missing in the parallel port of the ST compared to PCs).
We also wrote our own software compatible with the ANS TCP/IP calls
from ATARI including telnet, lpr, ftp, popmail ...

Peter.

It is a software (hard disk driver) limitation.

> > Also, when checking the partitions of my current drive, I noticed the
> > software said that GEM only supports 16 Meg partitions adequately. Is this
> > still true?
>
> TOS 1.0 and 1.2 had this limitation.

The truth is that GEMDOS can handle 32768 logical sectors per partition
at max. At 512 bytes/sector, this adds up to 16 MB. With bigger logical
sectors, you can have partitions up to 256 MB.

>For TOS 1.4 and above, it is 32mb per
> partition.

With 512 bytes/sector, no. There are still bugs in TOS 1.04 and
above that might bite you if you have partitions with more than
32768 sectors, so the limit is still 16 MB (with 512 bytes/sector).

To enable the purchase of a Falcon030 I am selling my Atari STE system, everything must go! Prices below are rough guestimates only as I have no Atari magazine to hand to see what current prices are... make me an offer!

Hardware:

Atari 520STE With 2Mb memory and TOS 2.06 switchable upgrade - 200 quid
40 Mb Power computing hard drive - ICD adaptor and software - 200 quid
Atari SM124 Mono monitor - 50 quid
Philips CM8833 clone - colour monitor - 100 quid

Software - no prices, just make an offer

NeoDesk 3
Lattice C v3
Hisoft C Interpreter
Degas Elite
Warp 9
GFA Basic 3
GFA Compiler
First word plus
STOS
STOS compiler

Midwinter II
Kick Off II
All 20 odd games that came with it...
Microprose F1GP

Books

Atari ST internals - Abacus
Atari Assembly programming - ZZ Soft - with disk

Miscellaneous

TOS 2.06 chips - suitable for upgrading an STE - these are entirely separate from the above switchable upgrade
Monitor switch box
Nice mouse :)

Well I think thats it at the moment, if anyone wants to make an offer for any of that stuff then just email me.

A friend in the department of computer science here has been trying to become a Falcon developer for some time (he can identify himself if he wishes). He has phoned and written to Alastair Bodin, Atari UK's developer contact, several times -- the Falcon would be an ideal platform for his reasearch on computer-aided learning.

Alastair Bodin continues to ignore him. Meanwhile, across campus in the Music Technology group, they have a number of Falcons and developer information. They're working on upgrading MIDIGRID for the Falcon. It seems that, in the UK at least, you have to be an Atari developer already in order to become a Falcon developer.

And Atari wonders why it can't attract developers...

The first problem is a side-effect of the second problem. Solve the
2nd and the 1st will go away too. You'll need to take off the case
and adjust the horizontal centering. Be careful you don't electro-
cute yourself (have a tech do it for you if you're not confident of
your abilities).

I have a color monitor I bought with the ST back in 1986 (or 1987?).
It seems to be working fine, but compared to the newer stereo color
monitor it seems very dark. Do the older monitors become more dark
with age, or are they just naturally a little darker? Knightmare,
in particular, is a little more difficult to play because of the
darker colors. Can anything be done to brighten the picture (other
than changing the Knightmare palette)?

Please note that monitors can hold a lethal charge for some time even when
unplugged!!!!!! If you feel comfortable with draining the flyback transformer
on a monitor, go for it. If that was jibberish, you should NOT open up the
case. You could get very dead.

If you feel that you absolutely must do it yourself, at least invest in some
plastic screwdrivers (designed just for this). They are very cheap, and
available at Radio Shack.

What are these bugs?. I have been using TOS 1.04 for over one year,with four 32
Mbyte partitions (512 Bytes/Sector).I have never had any problems apart from
using disk editors/de-fraggers that could not handle >16Meg.

I use folder100 in the auto.

I thought that TOS 1.04 was supposed to sort these disk bugs out.
The only strange part is the negative sector numbers (Supra Utils).

True, but the default block size (bytes per sector) is 512k, and many programs
have problems with any other value. BGM partitions (those with blocks
of larger than 512k) can be used for mass storage and such, but I have not
had much success with anything but the desktop.

BTW, BGM partitions are a feature of the ICD host adaptor software. To my
knowledge, they were the first folks to do it. My understanding it that is
has become a semi-standard.

> >For TOS 1.4 and above, it is 32mb per

> above that might bite you if you have partitions with more than
> 32768 sectors, so the limit is still 16 MB (with 512 bytes/sector).

Eh? I personally do not have TOS 1.4, but I have several friends that have
been using it (and 32mb partitions) for years without problems. There was
a time when some disk utility programs assumed a 16mb limit (which caused
some problems), but most of these have been upgraded or superceeded. For
example, early defraggers stopped at the first 16mb (which was not particularly
healthy for the disk). Newer utilites support the 32mb standard, as well
as BGM partitions.

So, what are these bugs you are referring to? Are you sure they are not
fixed by one of the myriad auto folder tos patches out there?

Internal adjustments in monitors do tend to drift over long periods of time.
You could probably get the monitor professionally adjusted and end up with a
brighter display (although, in some sense, brightness and focus are related,
with brighter being fuzzier). This kind of work needs to be done with an
ocsilloscope and a spec sheet. There is a related thread about monochrome
monitors in this group.

The speed of a routine is not determined by the number of lines, chum.

512 bytes is a SMALL lookup table! Post the two pieces of code and
all the people who ARE programmers might be able to explain things
to you, so you won't have to make uninformed statements like:

> No wonder Atari is going down the tubes with Programers like that..

Atari have excellent programmers, it seems to me. You'd better check with
your fellow Atari-bashers (Bob Mauritz?) - you guys are supposed to be
bashing upper management, not the workers.

I've been quite inactive in this group for the last year or so, but
I happened to catch your post.

Before I get into it, is it your goal to use GEM and also have 100.00000%
data accuracy? (If so, I can't help you)

I wrote a reliable level 6 interrupt handler, but bypassed GEM by grabbing
mouse and keyboard events myself and queueing them up to be processed
in the background. I had to write a small windowing system to have "windows"
in my programs.

It's possible to display the COMPATIBLE-Modes on VGA/SVGA/ms-monitors (with 60Hz)
|> 2) If I buy a multisync, is it worth getting one that does 15-40khz, or
|> should I not bother with 15khz and get one that does 30-60khz (bearing
|> in mind add-ons such as ScreenBlaster, graphics cards etc which will
|> provide greater resolutions)?

You'd better get one without 15 kHz. Only one programm (CEBIT93.PRG) isn't able to run on a TV (silly thing as ATARI hasn't any RGB-adaptors yet) - all the others only need the compatible screen-memory.
I bought a 17" NoName (AOC735) three weeks ago (30-64kHz .. 50-90Hz but works with 27.5kHz and even with 245Hz too.
And since my default-resolution for CALAMUS is 1024*768 now, or even 1280*960 (with BlowUP030) I really like working with this machine now.

|> 3) What is the chance that after buying an SVGA monitor, most programs
|> are written with TVs in mind and not VGA monitors. How dependent will
|> games and other software be on the screen mode and monitor being used?

If the games are either stupid or very time-critical there might be problem ... but ATARI asked the developers to write flexible enough for both TV and VGA.

|> 4) Will programs like FalconScreen and super78 work on an SVGA monitor?

Super_78 NEEDS a SVGA cause it's the forerunner of BlowUP030

] GEM only supports 16 Meg partitions adequately. Is this
] still true?

Nah. TOS 1.4 and higher supports partitions of up to 32Mb, but decent HD software can use logical sectors - sectors w/ >512 bytes each to increase the size. Try ICD's HD utils.

Only programs that directly access the disk come in touch with this: disk
monitors, re-organizers and such. If they don't work with more than 512 bytes/sec,
they are probably older than 3..4 years.

>

A friend of mine is writing a GEM program and he wants it to be as compatable as possible. After developing on the Falcon for a while, he's noticed that the new 3D scroll bars are a bit thicker. What he needs is an easy way for his program to check the GEM scrollbar width for the system, so he doesn't write anything on top of the scrollbars. Is there a location in memory that tells the current width of the scrollbars for the current resolution and version of TOS? He's using GCC.

Thanks,

Dan Aylward

I personally use a Monitor Master switchbox (switches between color and mono monitors), which has an audio jack on the back. Given that you can find the connectors needed, it should not be too difficult to rig up a cable that had an RCA plug on the side for sound (that could plug between the ST and the monitor plug). As for amp/speaker, I use a boom box. However, amplified computer speakers can be had for as little as $30 a pair (at least over here) due to the recent popularity of sound boards on PC's.

I use 6.0.4 with mine (I'm still using Spectre v2.65 BTW). With 3.0
(or soon 3.1) I would probably dare to go up to at least 6.07
(as alot of newer software seems to want that)...

There is an AES function that returns the dimensions of the window interior
as well as the exterior (whole window with whatever gadgets you've attached.)
If he uses this function he should have no problem.

Don't know what is's called of the top of my head, though.

Randy

The AES handles this for you. Your friend should use wind_calc() and
wind_get() to obtain all the values he needs.

wind_calc(handle,1,kind,x1,y1,w1,h1,x2,y2,w2,h2)

Kind is the window components
x1,y1,w1,h1 should contain the full size of the window including borders

The AES will place the work area exluding borders in x2,y2,w2,h2.

Hope this helps.

I tried installing 6.0.5 several times, and couldn't get the bloody thing to load. System 6.0.8 loaded on perfectly. (I used to have 6.0.4 with relatively few problems, but Pagemaker 4.2 requires 6.0.5 or higher, hence the fact that I installed 6.0.8. I think my problems is my disk drive not being able to read Mac disks very well, and this has always been a bug with my set up, no matter what system I use. Somebody mentioned that there's a potentiometer on the Spectre cartridge that I can adjust to fix drive reading problems, but I have not been able to get any documentation. Can anyone help? My main problem right now is that the system crashes or I get "bad disk" readouts when I try to load large Pagemaker files. Tonight I'm going to try to load the files from my floppy onto my hard disk, and then open the files, and see if that helps. The wierd thing is that sometimes the files will open OK, and sometimes I have the problems. I understand I'm not the only one who is experiencing this kind of thing. My E-mail is full of people who experience similar bugs.

3000. uEmacs 3.12

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-27 03:19:06 UTC
From: cburke@nexus.yorku.ca
Message-ID: <cburke.738472746@yorku.ca>
Source record: 38413
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MicroEmacs 3.12 has been out for about a month now (you can get the source all over the net as ue312dev.zip, for example from von-neum.uni-muenster.de in the directory /pub/Micros/Micro-Emacs), but I can't find a compiled version for the ST. Has somebody got one? If so, can you upload it someplace?

This is a bit urgent, because the version of 3.11 available on atari.archive and elsewhere has a very bad bug: if you try to save a file onto a full disk, it bombs.

Thanks,

Most of the downloads I get are ARC or LHARC compressed, but yesterday I pulled some .ZOO archives from Umich which I couldn't unpack at home.

I have ZOO on the VAX at work, and *that* ZOO was able to unpack the archive, but the one I have at home couldn't...no error messages, nothing, it wouldn;t even list the archive contents. I got around the problem by unpacking on the VAX and repacking wih LHARC, but I'd rather not have to do this in the future.

Does anyone know what version of ZOO I should be using to be current?

3004. Hooking a CD-ROM to my Mega 4 ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-27 09:22:34 UTC
From: ralph@cerfacs.fr
Message-ID: <RALPH.93May27092234@hal.cerfacs.fr>
Source record: 38417
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have recently gotten a SCSI CD-ROM at the Computer Shopper in
London, UK. I vaguely remember that there were problems between Atari
software and modern CD-ROMs. And I seem to have a problem with mine]
My Mega 4 does not see the CD-ROM. Nevertheless, ICD's IDCHECK does
successfully communicate with it:

TOSHIBA CD-ROM XM-3401TA

So, I believe that it is correctly hooked up. I am using ICD Pro BOOT
6.0.8 together with MetaDOS 2. For these tests it is my *only* SCSI
device.

Any suggestions, anyone? I am currently at a loss.

Thanks,

Got a rejuvenated Mega 4ST with TOS 2.06] Do I *really* want a Falcon/Next/Sun?

3005. OMTI + TOS2.06 ?

Newsgroup: comp.sys.atari.st.tech

Hatari!

A friend of mine uses the GE-Softs adapter with the OMTI-Boot-PRG. It works fine with an Mega ST, but on an old 260ST with 2.5 Meg and TOS2.06 the HD does not work. Many write-/readerror are shown, so that you can't work with it.

Maybe it is the cable, there is now a 10cm longer one in it...

Can't I use longer cables? Or is the TOS2.06 not able to cooperate with the OMTI-driver?

ThanX, Roland

I wonder, why anybody would want to know the dimensions of window
gadgets. Usually the size and placement of these gadgets is entirely
up to the window manager. Currently a networkable version of GEM is
being worked on (Prax) and (theoretically) some day, you might be able
to remotely run your GEM programs on (e.g.) a UNIX box with an X
window manager (e.g. olwm). You would run in serious trouble, if you
relied on the size of those gadgets!

Whenever you want to output to your window, you should determine the
current size of its workarea by calling
wind_get(handle,WF_WORKXYWH,...) and match this value against the
rectangle list *and* the workarea of the desktop
(wind_get(0,WF_WORKXYWH,...)). If you need to calculate the outer
dimensions of your window, you can do this by calling wind_calc(); but
never ever rely on these outer dimensions having a fixed size or the
window gadgets being located at a fixed place!

I would not do this. Writing something in the window bar is a very bad idea.
You cannot handle this bar correctly because you normally don't get redraw
messages for the bar. This is handled by the screen manager.

Many people have used oversized partitions, and in most cases they didn't
have problems. A fellow netter (Juergen Lock) has disassembled quite
a few parts of GEMDOS (both in TOS 1.04 and TOS 2.06) and found problems
in internal functions that are called by Fread/Fwrite when you are
writing large chunks of data. Juergen, are you listening?

Not true. BGM partitions were introduced with AHDI 3.00 and are documented
in the AHDI 3.00 specs. This is an ATARI standard.

> So, what are these bugs you are referring to? Are you sure they are not

They are definitely not handled by any auto folder patch that I know
of. I think I have a description on my HD at home; I'll have a look.

I don't know if it's this, but I've noticed that if I boot Spectre
from my hard drive, and do *not* have a double-density disk inserted
while booting, then it seems to have problems reading *Mac* disks sometimes
(Spectre-format disks seem ok). However, if I *do* have a double-density
(mac/spectre) disk inserted when I boot, and then mount the floppy and
eject it, then it seems to work fine. Strange, but it seems to work for me...

3013. BCONFIX -1.0 BETA

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-27 12:23:00 UTC
From: Don_Maple@kr.maus.de
Message-ID: <A23968@KR.maus.de>
Source record: 38263
Body handling: Inline uuencoded payload not displayed: BCONFIX.PRG

Howdy pardners!

Here's a little fix for the Bconmap problem on the Falcon.

The problem: Bconmap on the Falcon has 3 channels MFP (6), SCC B (7) and SCC A (8). However, the size of Bconmap table is inadvertently initialized to 1 while the default channel is set to 7 (index 2)! Since the Bconmap table starts with 6 (index 1), this is... ehm... an oxymoron...

In other words, as long as Bconmap is not changed everything runs fine.However, an attempt to change Bconmap effectivelly shuts the serial port down. Trying to reset Bconmap back to 7 also fails! Namely, the OS considers channel 7 (or anything above 6!) out of bounds and always forces Bconmap to 6, MFP, which on the Falcon is NOT connected to the serial port.

The solution: Increase the size of the Bconmap table to 3 so that all three channels are available. It is up to the communication program to realise that on the Falcon channel 6 is connected to... ehm... another dimension... If the Bconmap table size is already GE 3 the program does not do anything.

NOTE: FPATCH1 does not seem to cure this problem as all it does is watch for channel 7 (doesn't help channel 8 any...) for Conin/out and Co(n)stat. It then forces it to channel 1. If it did this for channel 6, then it might have been a semi-solution. But as it stands it seems of very little help since channel 7 is just fine! In any case the approach taken in FPATCH1 only seems to deal with the symptom and not the cause i.e., the inability to change Bconmap!

Shake before use: BCONFIX can be run either from the AUTO folder or the Desktop. Running it repeatedly does not do any damage as once the Bconmap table size is fixed the program just exits gracefully...

Please test this on your setup and report should you encounter any problems. If everything is hunky-dory over the next couple of weeks I'll then provide a release version in the PD. In the meantime consider this _P_rivate _D_omain... ;-)

I'll also welcome any suggestions/criticism/praise/money/beer... etc

When you open a window in GEM you can just get the dimensions of the
work rectangle which is the space a program has to itself. You only
need that data not to overwrite the scrollbars. Just do a
wind_get(window_handle, WF_WORKXYWH, &x, &y, &w, &h);
and x, y, w & h will contain the work rectangle.

Now, I've found two possibilitys: Write a nonzero byte; the desktop answers: "You cannot drop ..."

Second: Write a zero. Then write some other stuff or not and try to read. Both programms (Newdesk and your own) are blocked by io...

Anyone knows how to proceed?

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

Interesting! I have found that if I format a disk in Atari Spectre mode in
Macintosh format first (single sided works and is quicker), and then go into
Macintosh mode, my machine seems to have a lot less problems reading Mac disks.

I've been using Pure C for a couple years now on a TT. There is no
explicit setting for a 68030, use the 68020 instead. Also use the
68881 setting, since the 68882 is insturction compatable with the 68881.
I'll have to check, but when you use 68020/68881 you need other libraries.
But this is just a small change to the project file. I'll try and remember
to send you Pure C sources for my implementation of the Mandelbrot algorithm.

The internal connector is a 50pin ribbon cable that follows the SCSI
specification. To make your life simple, when you buy your new drive
get it in an external SCSI drive case with power supply, and a MAC 25
to 50 pin SCSI cable. When you get the drive switch the new drive and
the one currently in your TT, or just use the new drive in it's external
case and have two drive connected to your TT.

>Most of the downloads I get are ARC or LHARC compressed, but yesterday I pulled
>some .ZOO archives from Umich which I couldn't unpack at home.
>
>Does anyone know what version of ZOO I should be using to be current?

Zoo 2.1 should be the latest version (at least the latest unix source, I think). I think I have seen a 2.14 for the Atari, but that may just be Atari-specific enhancements or something (?).

To play it safe, I'd just get ZOO 2.1 (zoo21.ttp) from atari.archive.umich.edu. To extract, use a command line line this:

zoo21.ttp -extract filename.zoo

Obviously, if you double-click on ZOO21.TTP, then just enter the "-extract filename.zoo" when prompted (or find a shell)...

Hope this helps...

Wrong. Because NEC has a trademark on the name Multisync, other companies had
to invent names that sounded like Multisync, so that everyone knew what was
meant. So names like Multiscan or Flexscan came up.

3024. Intermittent ST Malfunctions (Was: JRI SIMM memory upgrade)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-27 18:42:59 UTC
From: hoser@dainbramaged.EBay.Sun.COM
Message-ID: <1u323j$a20@male.EBay.Sun.COM>
Source record: 38425

Does anyone have any insights as to what may be the problem?

First, I've had the JRI upgrade in my system for about two years, and have not had any difficulties with it. I found it very easy to install -- just a few solder connections. I easily added the second video shifter recently. I've found the JRI board well designed and easy to add.

Recently, however, my system has had some rather unusual problems (and the reason for this post).

I had not had any problems with the system since I'd purchased it and added the memory, but within the last few months the system will occasionally reboot itself for no apparent reason. Sometimes it won't even complete the auto programs and accessories before it reboots. Sometimes it doesn't reboot, but instead produces bombs. And sometimes it will just lock-up completely, with no messages at all.

Due to the random nature of the problem, I doubt software is involved; it has even happened when booting from a floppy disk without any auto programs or accessories. It ran Lemmings just fine the other night. It then ran fine for about an hour before I voluntarily powered down. One time through the boot process, though, the auto program to set the keyboard clock said it couldn't find the clock module and then proceeded to freeze when the acc tried to display the clock. I disabled the auto program and the system re-started fine. I later re-enabled the clock auto prog, and the system booted without a problem.

This is really getting weird.

I believe the problem is in one of 3 locations:

1) The memory upgrade: This is actually the least likely problem. I recently re-soldered (after de-soldering) a couple of the more questionable spots. Also, the only memory test I have shows no problems, although even it froze the first time a ran it!

2) The keyboard: I have had a couple of wires between the cpu board and the keyboard break at the keyboard, but I thought I was successful at re-attaching them. At least the continuity tester said they were connected afterwards. I could be wrong. However, the system still froze after I swapped the keyboard with a DEKA adapter and a Zenith (XT) keyboard.

3) The power supply: This, I think, is the most likely suspect. I think I've pushed it to it limits and it is occasionally

overloading. I've been planning to purchase a new (BEST) power
supply, anyway -- I may get one just to see if the problem goes
away.

My setup is a 1040ST upgraded to 4 Mbyte with the JRI upgrade (with
second video shifter added (though I should note that the problem has
occurred both before and after I added the second shifter). I believe
the clock is a Z/Time clock (the system was purchased with the clock
installed), and I have both mono and color (actually a Commodore 1804)
monitors connected via a do-it-yourself switch I purchased at B&C
Computervisions.

The problem had occurred with a variety of software, though seems to
happen more frequently with the mono monitor.

I'd appreciate any assistance anyone may have about what may be causing
this problem.

Thanks in advance.

3025. Which HD can I put in my Mega ST2 ?

Newsgroup: comp.sys.atari.st.tech

From: bacha@taloa.unice.fr
Message-ID: <1u34g9lNNc3c@taloa.unice.fr>
Source record: 38419

Hello everybody,

I just want to know if I could put any Hard Disk, including pluging cards,
in my Mega ST2, like DMA, SCSI, IDE, other.

What I need is a big HD (like 200-300 Meg), not a Megafile-30 ...

Thank you in advance,

Laurent

Try Applications/Dtp/Fonts/Pagestream/chancery.arc
^
I requested (and received) this file last week. What I have found out
about the index, is that you must capitalize all directories and
subdirectories, while leaving files lower case.

Fun, huh ?? :-)

3028. RDE Version_4 (sent to a.a.) can remove ramdisks in ANY order.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-27 19:58:52 UTC
From: wabe@ukc.ac.uk
Message-ID: <4510@eagle.ukc.ac.uk>
Source record: 38422
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

```
RDE ( Version_4 ) - Significant upgrade on RDE_Version_3.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

(Distribution to the Public Domain

by kind permission of

Mark Williams Company)

Hot on the heels of my last submission of RDE (Version_3), comes Version_4 with the very significant upgrade that loaded RDE/RDY ramdisks can now be removed (dropped) IN ANY ORDER WHATSOEVER. The restriction of "Last in First Out" that ALL previous versions of RDE/RDY have had is now lifted. Otherwise this has ALL the features of Version_3 and is FULLY compatible with all previous RDE/RDY ramdisks and saved ramdisk files. Unlike Version_3, I've packed RDE Version_4 with the ICE (v_2.4) packer which is MINT-compatible. You can unpack it with Marinos Yannikos' NAUGHTY unpacker if you like.

Why did I submit Version_3 a week or so ago if I was working on this? Well, I WASN'T WORKING ON IT! - and the idea only occurred after the latter was submitted. I was also led to believe that this could not be done within TOS - but I persevered out of interest. After finding out by "trial and error" about OEM cruft links and the way TOS boots-up its hard disk partitions I finally could see how this (very desirable) feature could be incorporated. For those who prefer to have as much RAM as possible and work with utilities installed on RDE ramdisks (like me!) this will make life much easier.

For example, I could be writing a paper within my SIGNUM2 ramdisk when I find I need to finalise some data analysis with Fortran. So I wish to load my RDE FORTRAN installation but, da*?*n it, I had forgotten to remove that CALAMUS ramdisk installation I was previously working with BEFORE loading the SIGNUM2 one and now there is no room for the FORTRAN one as well on my 4 Mbyte machine. With Version_4 it becomes possible to get rid of that CALAMUS ramdisk I've finished with to make room to load the FORTRAN without disturbing the SIGNUM2 installation at all (Of course - there will be a warm reset - so you must save your document to file on the ramdisk first - come to think of it you'd HAVE TO anyway with SIGNUM2 as it does not allow the execution of external programs from within itself.

I'm sure that other RDE users can see similar benefits. This now makes me extremely envious of Falconers and TT'ers with 32 Mbytes or so. (Thanks to Ofir Gal who has verified that Version_3 works OK on a Falcon.) They could install huge applications (given that Version_3 removed the bug

that previously had limited RDY ramdisks to no bigger than about 2036 kb) or a huge number of smaller applications simultaneously. I must get one of those Falcons..... but with Maximum RAM as a PREREQUISITE so that I can defragment whole Hardisk Partitions (<= 16 Mbytes) in safety on a huge suitably configured RDE ramdisk in a few seconds (minutes?) only. The only risk is in "sector copying" the defragmented ramdisk (with DFT.TOS) back to the Hardisk Partition. But this should be QUICK (few seconds) and you'd have to be unlucky indeed for the electricity supply to fail during that time!!

My apologies to the archivists for bothering them again so soon after Version_3 was downloaded. But I guess they must be used to this phenomenon for I know of few authors who can discipline their minds not to continue thinking about the task that's occupied a hefty % of their "thinking time" for the previous few days - so if further good ideas occur to them....!! I guess this must be a phenomenon well-known to software archivists & justifies an appropriate "delay-time" before submissions are archived that sometimes annoys "over-keen" authors.

For the curious, RDE ramdisks install themselves at the top of memory and decrement PHYSTOP to allow space. Removing a previously loaded ramdisk leaves the "stack" fragmented - and it is necessary to pull its tail up to fill the gap. However you must do this in a way that TOS will not complain about and plunge your machine into utter darkness out of which re-birth (i.e. a cold boot) is the only solution. This involves monitoring the values of several "vectors" held within RDE's bootsectors to take into account the ensuing change of addresses of the routines these vectors point to as well as altering in a different way the cruft-link pointers that RDE uses to "find" its disks etc. etc. Anyway now I've got the sums right - the whole operation happens usually within about a second and reliably.

There are a few minor quirks. If you remove your "booting" ramdisk then, after a warm reset, booting defaults to A:\ (all this assumes you do NOT make your Hardisk (if any) self-booting from C:\ - Rather Harddisks MUST be woken up AFTER the ramdisks have loaded - preferably from a prog. such as AHDI in the AUTO folder of a "booting" RDE ramdisk (see IQ_BOOT the intelligent booting sourcecode for a tailored booting program that I sent with Version_2 of RDE last year). If subsequently you reload your booting ramdisk off A:\ you will get a normal "loading" warm reset usually followed (at least with ICD Harddisks) by another warmreset after which your booting ramdisk will take over control. There is nothing to worry about in this - it is normal and your data should be intact. HAVING SAID THAT I EMPHASIZE THAT NEITHER I (nor Mark Williams Co. who developed the original RDY) CAN BE RESPONSIBLE FOR ANY LOSS OF DATA, ACCIDENTS ETC. THAT MIGHT ENSUE FROM THE USE OF THIS SOFTWARE. THIS SOFTWARE IS NEW! AND, AS SUCH, SHOULD BE TREATED WITH CARE (but it's passed all my tests so far - wabe).

W. Alan B. Evans.

Source record: 38421
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Has anyone ever compiled Taipan for the ST??

Thinking it was the same "Taipan" that was released for the Apple2 family
a looooooong time ago, I bought a PD (or was it Shareware) disk with the game
"Taipan" on it (This was at ACE in Toronto last year - off TAF, I'm sure).
However, the proggy was in GFA Basic so I couldn't play it (bah!)...
Anyway, having gotten a PD version of GFA (off a STformat CoverDisk) for the
express reason of compiling the blimmin game, I was knackered when it didn't
compile at all!!!

Can anyone help me out here? If it's okay, I'll even post up the source....
if any of you want to have a go at compiling it! :)

Posting's or e-mail appreciated.

Vaya con Dios,
AcEzE.

What are your settings in your config.sys file? (bet most of you never thought
you'd here that in reference to an Atari!) Make sure that the hardware driver
points to the SCSI address of your CD drive, and the software driver points
to the hardware driver. It's a messy file but it works. Also make sure that
you are using the hardware driver from ICD not Atari. The Atari driver has
some problems with brands other than Chinon and Sony.

I can switch my CD-Rom, Chinon 431, from my SCSI to my DMA port this weekend,
and get back to you with the results. I'll send you a copy of my config.sys.

You will need a 3.5" SCSI drive, as big as you want, and ICDs
Micro Host adapter kit. I am not sure if this kit is still available
but you can call ICD and check. The kit contained everything you
needed to mount a 3.5" SCSI disk INSIDE a MegaST.

>partition. I am not sure about the Falcon/TT.

That is only right if you use 512 bytes/sector.

If you use 1024 bytes/sector and (any) TOS >=1.04 your partition limit
is at 64 MByte(BGM). You can use up to 4096 Bytes/cluster.

Atari's HDX does not support this. You have to use Hushi (SCSI-Tools
from Julian Reschke) or HDDRIVER (from Uwe Seimet).

The CEBIT93 Demo works fine on TV if you plug the SM124(etc.) adapter
into the monitor port as dummy. The programmers of CEBIT93 were just too
silly to ask for the TV - maybe they didn't know TV is nearly the same
as RGB.

The SM124 adapter is available here in Munich for DM 30 (~US$20).

3035. ZOO 2.1 - pet peeve and a request

Newsgroup: comp.sys.atari.st.tech
Date: 1993-05-28 02:06:12 UTC
From: mgm@world.std.com
Message-ID: <C7psID.F9z@world.std.com>
Source record: 38426

I use zoo 2.1 often and generally am impressed with it, but I've run into an insurmountable problem...

When using a simple command (verbose listing for example) after finishing the listing ZOO pauses and says "Press any key to continue." This would be fine except for two situations: (a) batch processing which I'd like to be able to use ZOO for, and (b) remote use. (Users of my BBS can run a door to view contents of a .ZOO archive, but at the end it waits for a key - and will only accept that key from the CONSOLE, regardless of redirection.

Is there another version of ZOO which doesn't do this? An option which I've overlooked? Barring that, is the source to the current version publicly available?

thanks for any help...

Every version of PureC allows 68020 and/or 68881 code!! You have to change
the libraries for the 68881 code.
There are some old versions of TurboC that have problems with the FPU but not
PureC.

>Does anybody use this software on a TT ?
yes, I do.
>If so, does it work well and does it allow you to produce TT-specific code ?
it works very well.

Pure-C always was and is working perfectly on the TT. If your code bombs, it might be a bug in your program :-) For 68882 code you need to link a special float library (pc68*.lib as far as I remember).

Does anyone out there have or has heard of Disk Drives Limited of Kent?

I recently had a major upgrade with my Atari STe by buying lots of new and second hand stuff.

One of the second hand ones was a 48Mb Hard Disk Drive.

Now, I did get a manual with it, and it has a technical helpline phone number, but it seems that the company has gone bust. I made loads of phone calls to Atari UK, Atari Workshop, Silica Systems and other major Atari dealers here in the UK, but none of them had heard of the aforementioned company.

I have opened the caseing to the drive, and found that the SCSI interface is by the same company. My problem seems to be that I don't know how to change the battery in the in-built clock, as I can not see where the existing one is. I really need to change the Battery.

Also, I'd like to increase the size of my HD by adding on another bare drive. How do I go about it?

Please help.

This is the upgraded German version, I hasve been told its the only one to use..

Robert Anisko
> anisko@usdtsg.daytonoh.ncr.com

There is this other Archiver called DC Extract Plus, Version 2.2B, does support all the Archive formats, but now shareware and being updated all the time, supports the new ZIP and ZOO and LZH archive formats, also has a built in text doc reader..

Should be on a Archive site near you....

Correct. My Idek monitor is called MultiFlat and compares to all
NEC MultiSyncs without any problem. It allows even higher sync rates
than the NEC4FG.

However, there do exist monitors with "multi" as part of the name that are
not true Multisync monitors. They can only provide a few specific sync rates
(for several PC video standards). These monitors are unlikely to work with
an ST (give a standard magic multisync box, like the ones Toad sells). The
point to note is that one should ask if a monitor in question is a true
multisync, or just a multiple-sync.

Do you have a Mega? I understand there is a well known problem with some
Megas concerning the GCR (the fix involves some additional shielding). I
only have a Spectre 128, so I cannot comment on drive problems (I am thinking
about upgrading to a GCR though :-).

So, does 6.0.8 work perfectly (except for sound)? I have not yet run into
anything I really need that is not happy with 6.0.5, but the time will probably
come . . .

This does not ring true!! I have been using a 32 Mbyte (logical
sector size 512) partition for years on my STE with no problems that I've
detected. FURTHER I have saved huge ramdisk files (i.e. containing ramdisk
contents) of up to 2 Mbyte sizes on these partitions with no detectable harm.
May I suggest your pal, Juergen, re-examine the code again and he may find
that what he "thought" was a bug is not one in fact. Or, if indeed there is
a bug with large file sizes, do tell us how to reproduce it - and at what
file sizes does it manifest itself.

Someone opined once in this Newsgroup (or allied one) that 32 Mbyte
partitions became possible when Atari suddenly discovered "unsigned" ints!!

No kidding, I've used 64k+ tables to avoid having to do division for some high performance graphics routines (involving inverse square laws and things), I didn't see that as any sort of problem. Maybe you non-programmers should read through some 68000 manuals and find out just how long some instructions take before posting such articles. I won't even think about mentioning storing of all the shifted graphics of sprites as well.......

The maximum sector size is 8192 bytes per sector which corresponds to a maximum cluster size of 16384 bytes. This means with TOS >= 1.04 you get a maximum partition size of 512 MB, with older TOS version the limit is 256 MB.

>Atari's HDX does not support this. You have to use Hushi (SCSI-Tools
>from Julian Reschke) or HDDRIVER (from Uwe Seimet).

HDX supports partitions up to 256 MB. This is compatible with _all_ TOS versions, 512 MB partitions need TOS >= 1.04. There might be a bug in TOS >= 1.04 so that you shouldn't use partitions > 256 MB but this is not quite clear. On my drives I didn't have any problems so far.

Anyone any success with compiling MiNTlib with Lattice 5.52? Mine makes (ok, projects) OK, but you need to add crt0.s and then the stuff crashes if you compile a file using it. Do you have to compile the lib INTO the existing LCNB.LIB? And can you compile it into base-relative?

David.

>drive. Is the internal connector similar to the external one ? If so, who
>now the exact layout of this connector ?

The TT's internal connector is a standard 50 pin SCSI connector.

You can either swap drives and put the old one into an external case, or
connect both of them to the internal connector. You'll need a different SCSI
cable with two drive connectors and a Y shape power supply cable.

Then place terminator packs to the following locations:

Two internal drives: onto the TT motherboard and the drive at the end of the
cable, nothing on the first drive.

Int+ext drives: terminators on the two drives, nothing on the TT board.

COMPUGRAPHIC FONTS...

There seem some confusion on the adverts for Pagestream, well to me there is.

The UK version of Pagestream, they are stating that it comes with
10 Compugraphic Fonts, but the US version only has 3.

Also I have the review of Pagestream, (ST-Informer) it stated that Soft-logik
with not be providing any more Compugraphic fonts..

Any idea's on this one...??

Hi--

can anybody tell me how to make use of the LAN port
in my Mega STE?
I'd like to connect it to a LAN of SUNs.

Is an Ethernet card available?

Any other ideas except via modem or serial are highly
appreciated!

[Article crossposted from comp.sys.atari.st]
[Author was Jim Rump]
[Posted on 31 May 1993 13:24:45 GMT]

Hello,

I like the atari computers and I also like playing with lots of
different software. The problem I'm facing now is a lack of diskspace.
So I want to make a CD-ROM with al kind of atari-software, such as:
ST, TT, Falcon etc...

I can not make only one CD, because this would cost me too much.
If someone else wants to have such a CD as described above, let me know so
I can cut the costs to < $100,-.

PS: If you want some special kind of software on this CD tell me, because
600 Mb is hard to fill up (No illegal software).

Please reply by mail.

Jim.

All of atari.archive comes to about 365Mbytes.

I think your biggest problem will be GETTING the files. At 50000 baud,
that would still take 21 hours of download time.

Get in contact with one of these sites and you may be able to get a tape
of the site - and I imagine you need a tape to take to the CD-ROM masterer
anyway.

SIMTEL-20 publish a CD-ROM of there PC archives for about $20, I'm told,
so there's no reason you couldn't do something similar.

Yes, sure. But it does not support 32 MB partitions with 512
bytes/sector. If I install a 32 MB partition it uses 1024 bytes/sector.
I don't want to be compatible to TOS 1.00/1.02! I want to save disk
space!

If you have a version that is properly compiled for the ST, it checks
an environment variable ZOOPAUSE before waiting for a keypress.

3069. NEW UUCODER (based on Steve Yelvington's UUCODER source)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-01 09:56:44 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.d&8xfqVT45g@elfhaven.ersys.edmonton.ab.ca>
Source record: 38273

In my never ending quest to write programs people like, I am releasing
a _completely_ rewritten version of ESS UUEncode/UUDecode.

This version looks quite a bit like UUCODER by Steve Yelvington. In fact,
it is based on the source code of that very program. I have made some
fairly extensive modifications to the program, and come up with this:

*) A *GEM Program* (menus, dialogs, mouse) that can both encode and
decode files (one program does it all). The user can set the size
of the file segments (if any) and whether or not the full path of
the file being encoded will be stored in the encoded file, or just
the filename. While encoding or decoding, the user is shown an
informative progress display, featuring a growing thermometer bar,
the name and path of the current file being processed, and the name
and the path of the target/source file. For users who like to install
programs on the desktop as icons, this program is equiped to handle
an unlimited number of files (like a batch). It will automatically
decide whether it should encode the file or decode it. The program
is faster than any other encoder/decoder I have seen, and has support
for the ARGV, xArg, and old-standard command line formats. The dialog
boxes are all moveable (click on the background) and the screen is
redrawn using raster copies. This program is ideal for floppy disk
users and hard disk users alike.

I hope people like this program (at least I hope they like it a lot moe than
the last version).

I have sent it to atari.archive.umich.edu (the filename should be ESSCOD36.ZOO
or esscod36.zoo) and comp.binaries.atari.st (which I hope will accept it).

3071. "sprite" editor... does one exist?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-01 12:44:09 UTC
From: klassa@aurs01.UUCP
Message-ID: <63234@aurs01.UUCP>
Source record: 38276

Hi-

About three months ago, I wrote a silly little mono-only game (well, not even quite a full game)... To create the sprites, I wrote a very simple sprite editing utility, that would create .h and .c files with the sprite data & initialization code in it (i.e. I'd define the sprites in a data file, and would get the .h and .c files by running the data file through this simple little utility).

This only worked well for mono, though... Doing it for 16-color sprites, at least using the same general scheme, would be unthinkable.

Before I set out to write something for 16-color sprites (something more along the lines of a mouse-based, point & click sprite editor, rather than a text file based editor), I was wondering if such a thing doesn't exist already. It would seem like one of the first things somebody would write for the ST...

I'm looking for something that would, minimally, allow me to to create sprite images (at least 16 bits wide, preferably more), and which would generate (as output) something along the lines of .h & .c files (containing mfdb definitions, and possibly even some code to initialize things) that I can incorporate into my own code.

What I'm really after, and which I might take a crack at writing myself, is something that will allow me to set up small animation sequences for individual sprites... Nothing extravagant -- just a linked list of images that I can use to give me sprites the illusion of animation (like a sequence that looks like a walking person, or of a pacman-like ball with a mouth that opens and closes -- that kind of thing).

Anybody seen anything at all like this -- even the "minimal" version I outlined first? Surely somebody has written one of these -- I can't imagine someone having written some of the games I've seen at a.a without one.

Thanks in advance...
John

3073. Re: CD-ROM for atari*

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-01 15:38:45 UTC
From: crissman@btree.uucp
Message-ID: <1993Jun1.153845.17676@btree.uucp>
Source record: 38277

If you're compiling a list of potential customers for this CD-ROM, put my name on it! I'd certainly like to have a lot of clip art on a CD-ROM ... pictures take up a _lot_ of disc space, and are seldom (if ever) modified. It would certainly free up about 30 Megabytes on my drive!!

There are scads of formats (*.PI?, *.TNY, *.GIF, etc.) out there, and bunches of format conversion programs, making it reasonable to include clip art from MS-DOS, Mac, and Amoeba platforms. If you put all of those on the CD-ROM, you could easily fill it. The hardest problems would be:

a) Coming Up With A Logical Arrangement, and
b) Figuring What To Leave Out.

In addition to the archives available on Internet, you might contact some of the public domain sources of software advertised in ST Informer. Some of them have been gathering software since the ST was brand new -- just remember not to use their categorizing methods!

If you get _really_ ambitious, you might even come up with a CD-ROM containing program demos that are already available. (Didn't somebody *else* have this idea, some time ago :) ?)

Music CD's probably cost around $2.50 each to master in quantities of 1000, so I'm assuming a CD-ROM would cost closer to $10.00 each for mastering. You could place, say, a $49.95 price tag on it, with a $25.00 "limited time introductory price". You could do quite well ... IF it sold. I know I'd buy one, but you might want to check and see what other interest you'd generate before you begin.

Good luck!!

The easiest and most productive way to develop sprites is to simply
use a drawing program, save them in some format you can read (like
Degas PI1 - the simplest format in existance [see Dave Baggett's picfmts
file for details]), then write a command-line utility to convert them
into C structures, or other sprite file formats that take your fancy.

Neochrome can save sprites to disk, already pre aligned to 16-pix boundary
(In case you define sprites that are not the good width) in format suitable
for assembly. They can then be assembled to form binary sprite files that
can be loaded at run-time, or integrated inside the code.
Neochrome Master has it's own sprite file format.
Plus, both offer the possibility of testing out your animations !!

Patrick.

Is it possible to connect Spectre GCR to a Atari Mega STE-4?
I only see that the drive cable is a bit short to go from the Spectre unit to th
That's right. The cable provided with Spectre GCR is too short for a Mega STe.
You'll need to buy a longer one. SURPRISE! (Thanks, Gadgets by Small).

I didn't succeed in configuring Spectre on my Atari.
Doe anybody know how to do this?

The first question I have is - do you have a 1.4 meg high density drive? If you
do, it won't work with Spectre GCR - at least you won't be able to load on the
Macintosh System/Finder. You'll need to buy an external, 720K meg drive as
a drive "B", or swap out your 1.4 meg internal with a 720K internal floppy.
SURPRISE! Once you get the system/finder installed, you can use the 1.4 meg
drive to read mac disks, but ONLY double density - Spectre GCR doesn't support
high density "yet". (I recommend trying to load the system/finder with an
external floppy first - maybe you can find a friend with one or a dealer who
will help you. If it works, you may want to consider buying a 720K meg
external drive as a drive "B") Good luck! :-)
p.s. I presume you have tried to contact Gadgets by Small with no success :-(
Don't feel bad. Nobody has been able to get through to them for quite a while.

>I didn't succeed in configuring Spectre on my Atari.
>Doe anybody know how to do this?

I use a Spectre GCR on my MegaSTe4. The cable I got with it just about reaches from the drive port to the cartridge (the cable kinda moves from the drive port across the back of the MSTe and into the cartridge). I did buy the Spectre GCR from someone, so I don't know if the cable I got was stock or not (you may need to pick up a longer cable).

WHat I did notice is that when you plug the GCR into the cartridge port, it doesn't leave a whole lot of room for the keyboard cable. However, this cable just about fits between the main part of the cartridge and the computer (barely).

As far as "configuring" the GCR, once you have everything plugged in as necessary, then you can just run the Spectre like on any other ST. While my Spectre doesn't seem to handle 1.44 MAC disks (I'm using Spectre 2.65 at the moment), the internal drive has no problems dealing with regular 800k Spectre and MAC disks. And running in 16mhz is nice...

Yeah, I guess there are lots of people here interested in this.
Maybe we could check just how many would be interested if the CD
Costed 45$, 25$. With such figures one could make out what would be a
reasonable quantity to produce. (IE. if lots of people are interested,
more CD's could be produced, which in turn lowers the production cost
per. CD)

Anyway, you could put me on that list right away :-)

kR> I don't want to be compatible to TOS 1.00/1.02! I want to save disk
kR> space!

Humm, if you know what you are doing, you could use a sector editor to
change the boot-sector. That's what I did (to get 1024 byte sectors on
64 Mb partitions).
If you make the sector-size half of what it used to be, remember also
to double the number of sectors (since each is half the size)
to QUADRUPLE the size of the FAT, since you:
a) Need a FAT twice the size of what
you used to have (more sectors)
b) Each sector is half the previous size

3088. Falcon DMA sample playing

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-02 20:08:38 UTC
From: vicb@clark.edu
Message-ID: <1993Jun2.200838.23585@clark.edu>
Source record: 38292

A couple of months ago, a local developer brought a Falcon to our user group meeting for us to play around with. One thing that we discovered was that the Falcon would not play any of the 6 kHz samples in any of the programs that we tried on it, although it would play the 12 and 25 kHz samples ** that were in the same programs **.

This was one of the earlier models of the Falcon. Does anybody out there with a more recent version know if this condition still exists?

Thanks in advance,

Victor Bruhn

It's very unlikely that someone will want to sell a 2nd hand copy of NVDI unless he's selling his ST and getting a PC or something. In the UK, you can get NVDI from The Atari Workshop 081-693 3355 for 50 UKP.

>This is a bit urgent, because the version of 3.11 available on
>atari.archive and elsewhere has a very bad bug: if you try to save a
>file onto a full disk, it bombs.
>
I have obtained this code and _TRIED_ to compile it for the ST
using Mark Williams C (the recommended compiler). All I can say is that
the code (as it exists in the above-mentioned archive) can _NEVER_ POSSIBLY
HAVE BEEN SUCCESSFULLY COMPILED. For example in the ST-specific source
file (st52.c) there is an identifier "mousehidden" which is completely
undefined. Now I guess this is the opposite of "mouseon", which is also
present, but _WHY_ have these _ELEMENTARY_ bugs not been ironed out before
submission? Does the author wish to waste people's time?

My conclusion is the source (as is) has never been compiled for
the ST and unless you have a great deal of time for "debugging" I would
not advice people to "have a go" at this.

Now the author, Daniel Lawrence (Funny, I had always thought of
David Conroy as the author of Micro-Emacs??) appears to wish that users
register with him if they use Micro-Emacs. Below is a part of his
"readme" file:-

!! If you like MicroEMACS, and want to see more work, new versions
!! and other shareware software to go along with it, show your support by
!! registering your copy. Send your registration of $25 US and I will place
!! you on the registration list. You will recieve information on new
!! releases and preferential support. If you have recieved MicroEMACS
!! through a software library, a CDROM collection, or a user's group, none
!! of those fees are passed along to the software author. Register with me
!! and get the latest versions, info and have a voice into future
!! directions.

May I suggest that anyone who badly needs Micro-Emacs 3.12 (I don't!)
CONTACT him and send the $25. Then perhaps he might bother to compile it for
the ST and send you the binary on (two) floppies as is stated elsewhere in
his documentation.

W. Alan B. Evans

3091. GCC problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-03 00:04:09 UTC
From: jhp@sactoh0.sac.ca.us
Message-ID: <1993Jun3.000409.1552@sactoh0.sac.ca.us>
Source record: 38296

I've been trying to get GCC(specifically G++), up and running.
When I compile, I get nothing but errors. The errors seem to
indicate that a semicolon or comment delimiter is missing
somewhere since it complains on every line.

Sometime back there was some discussion about unLZHing the files
and dealing with a ctrl-Z or EOF. Could this have something to
do with it?

I took the files from wuarchive.wustl.edu(which for some reason
I want to say I thought I read somewhere that the files from this
sight had problems to begin with). Has anyone else had this
problem with the files from wustl?

Any and all help is greatly appreciated.

Thanks, in advance.

>Macintosh System/Finder. You'll need to buy an external, 720K meg drive as
>a drive "B", or swap out your 1.4 meg internal with a 720K internal floppy.

Nope. I have no problem using double-density 800k MAC disks in my MSTE4
withinternal 1.44meg floppy. It's only the 1.44 MAC disks I can't use yet
(as Spectre, at least the version I have, doesn't support it yet). No need
for extra hardware...

Back to the question - as long as you have the system/finder disks on
800k disks, then no problem...

>SURPRISE! Once you get the system/finder installed, you can use the 1.4 meg
>drive to read mac disks, but ONLY double density - Spectre GCR doesn't support
>high density "yet". (I recommend trying to load the system/finder with an
>external floppy first - maybe you can find a friend with one or a dealer who
>will help you. If it works, you may want to consider buying a 720K meg
>external drive as a drive "B") Good luck! :-)

If you want to install the System finder on a hard drive, then yep you'd
need to boot from 800k floppy first (luckily various versions of the
systems disks at ftp.apple.com are available in both 800k and 1.44 images).
As long as you stick with 800k MAC disks, then you should have no problem...

>p.s. I presume you have tried to contact Gadgets by Small with no success :-(
>Don't feel bad. Nobody has been able to get through to them for quite a while.

Try again - apparently they hired a new phone person recently. I called
them last week, and they just sent me an order form (which I requested,
as I'm planning on upgrading from Spectre 2.65 to 3.0 or 3.1 (3.1 if
I can wait another month or so :-) Anyways, someone answered and helped
me out... (yes, Dave's still around :-)

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...since we're on the Spectre topic, I'll let everyone know about something
I found helpful (something that really took too long to find out) - I had
connected to the Apple FTp site (ftp.apple.com) which had various IMAGE
files of various Systems disks ("Image" files are like MSA files on the
Atari). Anyways, I was having a heck of a time trying to convert the
image files onto floppies. Well, my solution was in a program called
"Mount Image" - this is a Control Panel program which will let you

treat the image file as if it were a disk - thus I put all four necessary image files on my hard drive, used "Mount Image" to mount them as floppies, and then simply ran the install program from one of the image floppies (one could also simple copy the files from the image "floppy" to a real floppy); just thought this might help some of yunz out there...

Let me guess. I use the Gnustuff copies (because the Mint ones don't
have G++ in them [sad, sad, sad]), and ^C doesn't work under TOSWIN
for those programs. I had the Mint GCC once, and ^C DID work under
TOSWIN for that. Therefore, I expect the Mint ones are compiled
with -mint, and hence understand ^C (and other signals).

We need a bit of co-ordination, I think. We have a choice of

- Mint/TOS version 2.4.0, with no G++
or - Tos version 2.4.1, with G++

(The Mint versions surely work fine under TOS?)

mgcc (or bmgcc) is compiled with -mint and linked with MiNTLib (pl30). This
means it behaves a little better under MiNT than a `normal' gcc. bmgcc is
compiled with -mint, -mbaserel and -mpcrel thus giving a shared text gcc.

Well I contacted Softlogik on GEnie last Friday, well they got back to me
to-day..

Well the ATARI version is ONLY 2.2..??

I asked about the extra Fonts, I was told that the Plus Pack disks was $10us
there was no mention of these fonts being included with the latest version,
so it looks like there are NO EXTRA fonts with Pagestream..

Note: there are updates for versions 2.21 and 2.22 in there file system on
GEnie but they are for the Amiga, so I think that some one has confused
the extra fonts and version number with the Amiga version..

NOTE: this has nothing to do with the 10 Compugraphic Fonts that I was
on about befor...

3100. Re: CD-ROM for atari*

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-03 10:14:35 UTC
From: rjansen@fwi.uva.nl
Message-ID: <1993Jun3.101435.9966@fwi.uva.nl>
Source record: 38305

Hi,
now with all that talking about CD-ROM for atari, can someone please
give me some more information about the possibilities available?

I have a megadrive with ACSI in and SCSI in/out. Is it simply the way
of buying a SCSI CD-ROM drive (like for the MAC), put it in, turn
it on and read? I guess there have to be drivers or something...

And which ondes are need to use Kodak PHOTO-CD? And which programs
are needed and available? I would really like to join the group
of CD-ROM users, but I need some introduction...

By the way: I'm working for my job around here with a SUN Sparc with
SCSI CD-ROM drive. Can I use that one?

Any help would be great!

Thanx in advance, Rene.

It's sad but it's true: the Falcon can't play STE-DMA-Samples in 6 KHz.
You have to use one the two ST-Emulators 'Magi' or 'Backward' to get the
STE-Sound. Both programms can be found on several ftp-sites (magi.zip and
backw143.zip).

Ciao, Heiko.

You need Metados (available from a.a.u.e).

>
> And which ondes are need to use Kodak PHOTO-CD? And which programs
> are needed and available? I would really like to join the group

You can use Metados, as long as you don't have a multisession CD. For
using the pictures, you'll need software capable of reading PCD
files (the only package I am aware of is from Color Concept, Germany).

>
> By the way: I'm working for my job around here with a SUN Sparc with

Should work (but might special initialization).

I have worked with Daniel Lawrence over the last couple of months to beta test
MicroEMACS 3.12. On my Atari 1040 STf I used Mark Williams C version 3.. and
have had no problem what so ever to compile the official released sources.

I find your remarks about "mousehidden" interesting and will look in to it.

In the mean time: I have a ue312.zoo file ready containing sources, cmd files
and an executable for the Atari ST. I intended to upload it to a.a.u.e but
could not find a directory where I could put it.

Point me to a system (domain name and IP address please) and a directory to
put it in and I will upload immediatly.

******** GUCK.. **********

Some time back I asked here about the New none PD version of GUCK 1.9..

I have since found a advert for it in a last years ST-User U.K. (April 92)
the advert is for GUCK 2.0..

It by a company called TITAN Designs Ltd, of Birmingham, U.K.

Is this firm still around..??

Thanks...........

Give GUCK a try I think its great, there are PD versions 1.8 on
many sites...

It can Auto read Text, Graphics and Fonts all from the desktop,
as a replacement to the desktop text reader...(show/print)..

Roger.............. sheppard_r@kosmos.wcc.govt.nz

I know I shouldn't be asking you, but probably bammi:

Can we have an Objective C compiler too? If someone decides to make one, it would also be desirable to disable the warning for #import in cccp.c (warn_import = 0).

I took a look at it myself, but the Makefile didn't have the rules for the ObjC stuff.

Message-ID: <1ukr2s$bhd@binkley.cs.mcgill.ca>
Source record: 38310

While optimizing some assembly code of mine, I came onto something I find very weird. These are the entries in the tables I have :

clr.w -(sp) => 6 + <ea>speed. For -(sp), this come to 8, so 14 cycles.
move.w #0,-(sp) => (straight out of a table, no calculations) 12 cycles.

It seems weird that it would take it longer to generate a 0 than to fetch it from memory. Could anyone tell me if these are the right figures, or if I should simply throw away my tables.

Thanks, Patrick.

From: v892307@si.hhs.nl
Message-ID: <1993Jun3.135840.7458@si.hhs.nl>
Source record: 38314

I wonder if anyone has written a MOD editor that runs in
high resolution (monochrome, that is). For the past few
months I've looked everywhere and only found editors that
work in one of the lower resolutions. Why is it so
difficult to get hold of a monochrome MOD editor ?

If nobody has one I have to write one for myself,
which I intend to do. The problem is that I can't
get an exact description of the (effect) commands
that may be used in MOD files. On the other hand
I DO have a description about the structure of
a MOD file.

Could anyone send me a description of the MOD commands ?

I'd like weird terms like "Tone Portamento" and "Arpeggio" to
be explained in terms which I can understand. Examples
that show how exactly a sound changes by inserting
a command with its parameters, are also *very* appreciated.

Thanks!

B.T.W.

Just a few words about the MicroEmacs situation. Daniel Lawrence has, in fact, been the guardian of MicroEmacs for at least 5 years now, maybe more. His interests appear to be more slanted to gee-whiz features than work-a-day ones. In general, people who care about a particular machine will take over and do a revision for it, passing diffs back to Lawrence. He tries to merge them rationally. Last I heard, his ST was broken, so he was trying to coordinate ST upgrades by eyeball, which can have its problems.

I got in the middle of things a bit on release 3.11. There were at least 3 really sharp people with firm ideas of where to take that one, in addition to some people who had contributed important code and then gone on to other things. At one point kbad was offering to clean things up for a base version everyone could work from, but 'other things came up.'

So yeah, the code is a bit mixed up. Lots of it is very good, though, and anyone who wants to get a stable base version (preferably compilable with GNU C) together, and distribute it widely enough so those people with firm ideas can try to work from it, is liable to make a lot of friends.

Steve

The figures are correct! Also, remember that the ST bus runs at 2MHz
and any operation on the bus will take x*4 cycles. The 14 cycles for
'clr.w -(sp)' really ends up taking 16 cycles.

Sorry, but I have no idea WHY the 'clr' is slower than the 'move'.
Maybe someone with knowledge about the 68000 micro-code can
comment on that. :-)

If you want to optimize your code even more you could zero a data-
register with 'moveq' and then do a 'move Dn,-(sp)'. It'll also take
12 cycles, but you could probably make use of the zeroed data-
register in some other operations as well. :-)

Don't know about mgcc, but bgcc is compiled as baserel using the mintlibs as
opposed to gcc which uses the gnulibs in it's makeup.

In an unconnected note - Warwick Alison's GEM++ class library for GCC/++ is
dead dead good.....shame that GCC is still so slow to compile on my F030
- maybe when I get that 32MHZ board from germany......

That sounds right. A glitch in the 68000 logic causes memory operands to be read before being zeroed with the CLR.x instruction. I think they fixed the glitch on the later (680x0) chips. One upshot of this glitch is: don't use CLR on memory mapped I/O devices that are sensitive to reads, since the the bogus read it does of the I/O register before storing a zero there might throw the I/O device into some other state.

I have heard from a friend that there is a device out that enables you to convert the modem port on an Atari to a Midi port thus giving you two Midi OUTs and a total of thirty two channels. Does anybody know about such a device. Apparently he read it in some magazine, music or Atari, but cannot remember which or where. It costs only about 30 pounds stg. I would be very grateful to anyone that could give me the proper name and where to get it by mail order.

He thinks it's called Modem Midi or something to that effect.

Paul

The best information about the Falcon is contained in the advertising brochure published by Atari. The back page provides detailed information regarding the System Architecture, the Digital Signal Processor, the Expansion Bus, Graphics, Sound, Scads of Standard Ports, Data Storage (disc drives), User Interface, and System Software.

This information covers more ground than advertising seen on almost any other platform -- a techies dream!

Check your local Atari dealer for a copy of the brochure, or call Atari and ask them to send one by mail.

If your assembler is smart, it will generate code for the move.w #0,-(sp) as moveq.w #0,-(sp). If this is the case, the zero value is tucked into a few bits of the opcode and the instruction requires just one 16-bit word.

Ted.

wR>

Humm, I am on bammi's mailing list and receive his updates to gcc.
Since approximately. ver. 2.0 I've been compiling gcc with the
mintlib, and that works just fine. I am currently running 2.4.2, and
could easily upload this to a.a. HOWEVER: I've compiled gcc with
-m68020 (and it produces 68020 code by default), so it would only be
useful for TT/Falcon owners. If anyone would like me to upload this to
a.a, please *email* me a note. (This is both gcc and g++)

NOTE: I do not intend to compile another copy for 68000
machines only, as I do not have the space on my HD for two sets of
gcc-source. I keep the object files after compilation so that I
do not have to recompile the whole shoobang when a set of diffs comes
along...

wR> (The Mint versions surely work fine under TOS?)

Dunno, it might have problems with filenames (/tmp instead of \tmp etc.)

Not meaning to flame anyone, but is there really any point in having a
shared text gcc ? I mean, you rarely run *several* gcc's at once ???
This is the only time that shared text gains you anything... In fact,
shared text runs quite a bit slower, since extra cycles are needed to
compute the offset. I tested this on a dhrystone program, and if i
remember correctly, the code ran some 20% slower with -mbaserel...

I have done so and found that with version 3.0.5 it is defined in linea.h as:

```
/*
* The mouse hidden flag/counter is at an undocumented negative offset
* from the structure pointed to by a0 after a linea0 (init) call.
* It is 0 when the mouse is shown.
* This is true in 11/20/85 USA rom and later, and appears to be
* true for all ROM versions of TOS.
*/
#define mousehidden *((int *)((long)la_init.li_a0-598))
```

Got a few replies on this. I will try to put it on:

ftp.cs.tu-berlin.d in pub/atari/incoming
(already tried it but my ftp session got aborted)

atari.archive.umich.edu in atari/New
(once I can get in)

So look for it there, or wait for it to be moved to a more appropriate place.

Source record: 38328

Do you need the manuals to use Pure C?

In my opinion, no. I use it quite intensively, and my german is not very good either, but I've never had a problem.

If you buy an English book on ANSI C and one on GEM/GEMDOS, for example K&R 2nd ed and the developer docs, you'll have the libraries covered. Together with the english text in the program itself that leaves only small corners of the program uncovered, for example the syntax of the project files (something like a make file).

The online help is also in german, but in situations like this a little german goes a long way, for example 'speicher' = 'memory', 'zeiger' = 'pointer', etc.

In short, don't let the german docs stop you, in practice it's not a problem.

=-=-=-=
C. van Reeuwijk e-mail: C.vReeuwijk@ET.TUDelft.NL

P.S.

I have such a high opinion of Pure C (formerly Turbo C) that when I was forced to buy a compiler for MSDOS I bought MSDOS Turbo C without hesitation. That proved to be a mistake, Pure C is *MUCH* better.

Oddly enough, a new Soft Logik newsletter just arrived. Much bragging about Amiga goodies. A new deal on fonts (1000 of 'em for $500 or so) and clipart. The promise they're getting tired of repeating online in print: they WILL continue to support the Atari line. They haven't decided what to do about Atari upgrades, and WILL NOT DECIDE until after PageStream 3.0 is released for the Amiga. A couple of new (relatively) printer drivers, including DJ550C and HPLJ4.

Ted,

You wouldn't get a very good grade in my 68000 course with this answer.
First of all on 68000 moveq is always long (and does not require a size
extension on most assmeblers). Furthermore moveq only accepts a data
register as its destination, so -(sp) as destination is just not allowed
for moveq.

The original poster of the problem (who stated that clr was 6 cycles and
the effective address calculation was 8):

My 68000 book says that clr.w on memory takes 8 clocks + effective
address calculation time (one read and one write cycle)
(by the way a clr.l on mem takes 12 clocks and a clr.l on a register
takes 6 clocks. clr.w on a reg takes 4 clocks. clr.b and clr.w take the
same amount of time)
This all from table D.6

effective address calculation (table D-1):
-(An) takes 6 clocks for byte and word and 10 for long.

Combining this it can be seen that clr.w -(sp) indeed takes 14 cycles,
but that 8 are for the clr itself and 6 for the <ea> instead of the
other way around as the original poster stated, and several people
confirmed. (except of course if my book is broken :-)

All,

It is a well-known fact that the clr instruction on 68000 is slow, and
that in most cases better alternatives exist. The major reason seems to
be that clr does a read on the address before clearing it. This is also
explicitly mentioned in the description of the clr instruction.

Frans.

PS: the book I'm quoting from is the standard 68000 user manual.
PPS: timing on 680x0 (x>0) is different and clr is implemented more
efficiently on some of these. Don't know the details right away,
and I don't have the book handy.

From: plord@uel.co.uk
Message-ID: <1689@uel.co.uk>
Source record: 38197

I hope someone can help me here ...

I'm using MiNT 1.04, MiNT lib 30 with gcc 2.3.3 and cannot get the _stksize to work correctly.

I'm setting _stksize to 0L in the hope that when the program is started, all the memory except 8k is freed back to GEM. In practice, all the available RAM is eaten up by my program.

I have tried many different values for _stksize but still even the simplest program consumes all of my 4M!

Any ideas?

Pete

3129. Zip/Unzip for the Atari

I do not know if this is directly related to the mgcc ditsribution (or fixed there), but it would be real nice if someone have a look at the utils also. The most annoying problem being that ld does not set executable permissions. Easy to fix, but there could be more stuff like that, so it would be nice if some of the gurus would look the files and qualify some of those `#ifndef atarist' with __MINT__ (or something similar).

Isn't going to help much. It's still dead slow on my TT/6/Quantum LPS.
I think some more atari-specific work needs to be done to GCC. And I am
convinced this is possible. Like an option which uses (shared) memory instead
of temp files; maybe a header cache, but especially the linker: it should
be capable of recognizing units within modules. As long as it doesn't,
turbo C programs will always be 70% the size of the GNU compiled stuff
(or less!).

>>If you don't get English manuals can anyone comment on how necessary
>>the manuals are for using pure C?
>I don't think you will need the manuals.

I think the problem is: How to get an _english_ version of the manual. The
development package includes all informations as an hypertext-like online
manual, but just in german.

The english Turbo-C-package is an `old version' of PureC, so the informations
in the online help are not upto date. But in general they should be enough.

Hi everyone,

Someone told me that it's not possible to access the TT serial ports via BIOS
by using devices 6-9. He told me you had to first select the right device via
a Bconmap call and then use BIOS device 1 (AUX). Is this true?
How is this handled in MiNT? Is it impossible for two seperate processes
to access different serial ports or is the Bconmapped port saved on a
per-process-basis?

Ta! Vince

The HSC MiNTlibs are progressing nicely, and may well be ready for release by tomorrow [if I can keep the compiler stable long enough to build them -- ah, the joys of beta-testing ;)]. In the meantime, I've uploaded to atari.archive some tools I've built and/or accumulated and have been meaning to make available:

cdecl.zoo
A straightforward port of Unix cdecl, an amazingly useful tool for deciphering cryptic C declarations to readable English, or vice versa. For instance, you can ask it to:

explain void *(*fred[5])(int, const char *)

and it will reply:

declare fred as array 5 of pointer to function (int, pointer to const char) returning pointer to void

cpp.zoo
A stand-alone C preprocessor, handy for compilers like HSC which don't allow direct access to output from the preprocessor stage. To the extent of my ability to make it so, it is entirely standard-conformant, including the concatenation and stringizing operators.

mit2mot.zoo
A bit more esoteric, this program translates assembly code in MIT syntax (as produced by GCC) into the more common Motorola syntax expected by most other assemblers. This is a simplified version of the gods-awful asm_pp hack I included with pl25 of the HSC MiNTlibs; all the functionality of the latter and more is now provided with the former in combination with cpp.

Enjoy. With luck, I'll be back soon with the HSC MiNTlibs.

I think I read somewhere (long ago) that the CLR instruction is buggy. It
makes a READ access to the memory location, which is unnecessary; this also
means that you shouldn't use CLR to access I/O locations.

BTW: If you do cycle calculations on the ST, remember that the video hardware
forces the CPU to make all instructions execute in multiples of 4 cycles.
If an instruction takes eg 6 cycles, the hardware will throw in two wait cycles
to make it 8.

Greetings,

Jens.

There is no moveq.w instruction available! MOVEQ is just for data registers and is always a long operation. There is even no room in the opcode to be used for the <ea> mode. If your assembler is so smart, that it creates such a code than it's a good example for "How to create illegal instructions without the knowledge of the programmer for wasting his time to find such bugs" ;-)

HELP ME! I have about a million questions about GNU C and MiNT.
For instance, how do I use the MiNTLIB instead of the standard libraries?
How do I know I have the latest archives? What are the updates directory
for? What are the GNU things in the MiNT directory for? How do they
differ from the archives in the GNU directories (on a.a.u.e). If I want
to use GNU C to compile UNIX programs for MiNT and TOS what is the best
way to do this? And what type of UNIX system should I compile for (sys V,
BSD, etc.). What are the naming conventions for the libraries, because I
want to delete all the archives except for the 16 bit 68000 and 32 bit
68020, not the other combinations. How do I specifiy the libraries? Will
GNU C choose the proper variations?

Anyone know how to use GNU C as a cross-compiler for generating 80x86 code?

Thanks, please send any help to evanlang@sdf.lonestar.org

Yes, you can use ka9q in server mode. However, I think the server
code is very ugly, and it needs a lot of work yet (at least the
version I *HAD*). ka9q has server mode for telnet, smtp(mail),
rlogin, finger and almost nntp(news). If I am wrong it means there
have come newer (==better?) versions since I gave up.
I can probably dig up the source if needed.

What are the differences between the various formats?

What is the minimum of PD/SW I would need to get minix or some such
program up & running on my ST. (e.g. to get a better file system than
DOS's crappy 8.3 filenames... etc.)

Minimum requirements? (I have a 68000 ST, not a TT etc.).

Advantages/Disadvantages....

Etc. etc. ANY info! (I'm sure there are a couple of other folks out
there who are wondering the same thing - of course, this is the net,
and the majority of people know everything, and use Unix anyway :)

Just interested......

3148. GCC

Newsgroup: comp.sys.atari.st.tech

I have been fiddling some with gcc (2.4.0) with Bammi's patches and
I've almost got a version that could maybe be merged with the standard
gcc distribution. That is for MiNT only though, but it would be great
to be able to compile plain sources. If I manage it, I will patch it
up to 2.4.3 and try to convince FSF to take it.

In case some of you did not know - Atari, Amiga and Mac people are now "joining forces" and working on a port of Linux (free UNIX for [34]86 machines) for 68k processors. The development is still in the earliest stages, with console and device drivers being coded. It will not work on anything less than a '030 or (maybe?) '020 with MMU. If you are interested, join the 680X0 channel of the Linux mailinglist. Send a mail to linux-activists-request@joker.cs.hut.fi for more information on how to join.

3150. Re: ka9q/MiNT?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-05 22:20:37 UTC
From: stigb@pvv.unit.no
Message-ID: <STIGB.93Jun5222037@fiolilla.pvv.unit.no>
Source record: 38202

Whoops, I forgot to answer your second question.
Yes, it is possible to let people log on with a shell, either with telnet through ka9q or just on serial ports. (Erling Henanger and I did this from my TT to his because he has 16Mb more ram than me ;) You should get the init packet and run a program called getty on each port. I'm not sure if ka9q must be rehacked a little to let exterior processes access it's sockets. But: Serial ports are very slow under MiNT. If you run ka9q with tcp/ip, you will with 19200 baud get an effective transfer rate of around 1kb/sec, and even less (maybe as low as 400cps or so) as soon as some of the users actually use the machine for anything. MiNT is not really made for this, but I hope the serial ports will work more efficiently soon. (I know it's not top priotity :)

Message-ID: <ersmithC8690o.Au1@netcom.com>
Source record: 38204

In article <1993Jun4.125041.26132@fwi.uva.nl> partingt@fwi.uva.nl (Vincent Partington) writes:
>Someone told me that it's not possible to access the TT serial ports via BIOS
>by using devices 6-9. He told me you had to first select the right device via
>a Bconmap call and then use BIOS device 1 (AUX).

This is only slightly true. The normal input and output functions (Bconout, Bconin, etc.) are accessible via devices 6-9. The only time you have to use Bconmap for another device is to do an Rsconf call to configure a serial port, or an Iorec call to change its buffers.

>How is this handled in MiNT? Is it impossible for two seperate processes
>to access different serial ports or is the Bconmapped port saved on a
>per-process-basis?

The Bconmap mapping is per-process. Processes can also access the different ports via GEMDOS calls (e.g. Fopen("U:\\DEV\\MODEM2",2) to open the second modem port), and set parameters with Fcntl instead of Rsconf.

There will of course be many more archives with a zip/unzip program for the
Atari ST, but mine contains my port. Try: ftp.icce.rug.nl and cd to
pub/erikjan/Atari. There you will find zip, unzip, zipnote and zipsplit.

] Could anyone give me an unbiased judgement on which is better the falcon
] or a similar amiga machine.

If you want a headache, get an Amiga. If not get a Falcon!

I'm AMAZED how badly the Amiga flickers! (This is the latest model
too - it flickers a LOT worse than Photochromes Software flicker on
the ST!).

If you want the machine for games, get the Amiga - as there are a few
already available that will work on the A1200. (From the A500 days).

Sound, Falcon wins.

Graphics -Falcon can win if someone writes a 1280*960 screen enhancer
program! (Can't be far off, we've already got 1600*600!)

OS - Falcon wins. (Looks a lot nicer, and is smoother to use!)

Support - Amiga

Currently Available add-ons - Amiga (Falcon numbers are mounting up....)

3158. HSC MiNTlibs pl30 uploaded to atari.archive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-07 01:06:28 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <739415187@amazon.cs.duke.edu>
Source record: 38213
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Sigh. I finally get pl30 done, and now it looks like pl32 is on the horizon. Being out of the loop really sucks, ya know? ;)

But anyway, now on atari.archive are the MiNTlibs pl30 compiled for HSC. The file mnthlb30.zoo actually contains two versions of the libraries -- one with 8-character external names for v1.40 and below, and one with 22-character external names for v2.00 and above (so that I don't have to re-release the library when v2.01 is released).

As always, in the event of the unthinkable (ie. bugs), you can reach me at this address.

3161. objc_edit() - GemFast (Bug?) OR: Generic AES Call?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-07 10:05:12 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.vJsElQodq8Y@elfhaven.ersys.edmonton.ab.ca>
Source record: 38230

Hi,

This morning I came across a problem with the GemFast C Bindings. I do not know if it is a bug, or just an undocumented extension. In either case, the definition of objc_edit() does not match the definition given in the GEM Programmes Reference: AES or used by the Alcyon (blech) compiler. The GemFast version wants six parameters, or it bombs with an address error. The Alcyon version, and the Atari documentation, want five parameters. I need the five parameter version, but I use Heat 'n' Serve C.

So, could someone tell me either how to do a generic AES call from "C" or what I should do about that sixth parameter? What makes it all worse is that I absolutely _need_ objc_edit() - there can be no substitutes in this case.

Please mail me with help, and I will summarize to the net.

I thought I'd like to throw in the fact that

MOVE.B ...,-(SP)

in fact decrements SP by 2 rather than 1 in order to keep the stack pointer
even (for obvious reasons).
However, you cannot use this feature when pushing the opcode just before a
TRAP because (in a typical piece of bad programming) TOS checks all 16 bits
of its opcodes even though neither Gemdos, Bios or Xbios have anything like
256 different functions.

Also, a handy optimisation is that

```
MOVE.W #$ABCD,-(SP)
MOVE.W #$EF12,-(SP)
```

can be written

```
MOVE.L #$EF12ABCD,-(SP)
```

A good assembler might do this for you.

>

Well, I guess you should have posted this to advocasy, but anyway, as an owner of three computer-systems, Amiga 4000/030, Atari ST and a PC386 I guess I could give it a try.

First of all, you should have stated what you will use your computer for. That would have made your question a lot easier to handle. But OK, here we go.

Graphics: Amiga scores high above the Falcon. It has more colours, larger palette, hardware sprites, and a faster, more advanced blitter. The Falcon has a DSP that can be used to good effect manipulating screen-data which the Amiga lacks. But most important, the Falcon has great problems handling 256-colour graphics. The machine halts to a crawl. It's been some confusion over the flickering (interlaced) screens that the Amiga offers. Yes, they still exists, but if you don't like them, don't use them. The 1200 offers plenty of non-interlaced hi-res screen-resolutions.

Sound: Falcon wins. The DSP-makes better quality sound, with more voices. The Falcon also offers a built-in MIDI-port that lets you connect MIDI-peripheral.

Processor: The Falcon has a 68030 CPU running at 16Mhz, wile the Amiga has a 68020 running at 14Mhz. That would make you think the Falcon is the faster machine, but that is not the case. The Falcon is really a 16-bit machine using a 32-bit processor (bus is 16 bits wide). This means that the Falcon has to do two memory fetches for every word, whereas the Amiga do only one. In addition, the Falcon shares the same bus as the display, meaning that it can only work in the time left over from screen-refreshing. In a 256 colour-mode , the display steals just about all the bus-bandwith leaving the Falcons CPU very little time to do it's work. This means the machine will crawl. The Amiga also suffers from a slow-down with 256-colour displays, but not near as much the Falcon. In addition, you can add fast-ram to the Amiga, and it will run at a 100% speed. Both machines has CPU-caches that will help them deal with bus-contention, but for other things than small loops, it will not help very much.

OS: 10-0 to the Amiga. The Amiga was built with a multi-tasking OS in mind, and now they have had 8 years of improving and refing it. And it shows. Very stable, very efficent and very userfriendly. The Falcons offering is a cludgy, first offering and even that shows. Slow, bug-ridden and completely minimal. Lacks lots of features that the Amiga offers.

Software-support: A poor machine can get away with it, if it has lots of software (look at the PCs). Well, the Falcon has a very small user-base and software support really could not get much lower. The Amiga market sure could be larger as well, but is in a much healthyer situation. I guess there are released software for the Amiga-Atari in a ratio of al least 10:1.

So if you want a machine for doing MIDI-stuff, then you would do all right with a Falcon. Even though you can do fine even here with an Amiga. Bars & Pipes Pro are breathing Cubase in the neck, and the new Bars & Pipes that is coming (with DSP-support) looks very interesing indeed. For ANYTHING else, get an Amiga. No doubt about it.

[mumble, mumble]

Njaal writes a lot, but sadly, he hasn't even been anywhere near a Falcon so
I would take his ramblings with a grain of salt. His talk about the Amiga
should be valid, though.

Jon who just had a few words with him! :)

You've got to be kidding if you don't include DTP and WP as other areas the
ST/TT/Falcon would be dominant. I'd have to say that it's more like, for
anything BUT video work, don't buy an Amiga. :)

There are examples of bad programming in TOS. Checking the value of inputs to a system call is definitely *not* one of them. If TOS ignored the high byte, then it would never be possible to have more than 256 functions on any of the traps. Since the Falcon XBIOS is already getting up towards that number (and MiNT's GEMDOS is about halfway there), that could in fact be a problem.

Besides, is MOVE.B ...,-(SP) really a win? It takes the same amount of memory, since in order to preserve word boundaries in the instruction stream any immediate data is always stored as a word. It takes the same number of cycles to execute. So why bother?

You might try DMC Publishing , the makers of Calamus. They are advertising cYrel Sunrise graphics card, or you can try Toad Computers for the Crazy Dots 15 graphics card, Toad Computers (in maryland) can also help you with the TT ram expansion board.

-Scott-

3174. RECLAIM (claim back 2 clusters on floppies) sent to a.a.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-07 14:42:07 UTC
From: wabe@ukc.ac.uk
Message-ID: <4677@eagle.ukc.ac.uk>
Source record: 38223
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just downloaded a new utility (RECLAIM.ZOO) to a.a. @umich.
The text file begins as follows and tells you what it's about:
Cheers,
W. Alan B. Evans.[wabe@ukc.ac.uk]

------------------- From RECLAIM_V2 textfile ---------------------------

For some reason best known to Atari, TOS "wastes" 4 sectors (or 2
1024 byte clusters) of formatted disk space. For example, with the standard
double-sided Atari format we have 1 bootsector, 2 sets of fats each 5
sectors long and a root directory which is 7 sectors long. The disk is
formatted to 80 9-sector tracks on both sides i.e. 1440 512-byte sectors
in all. Since the "disk management" accounts for 18 of these, one might
reasonably expect there would be 1422 left over to hold data i.e. we'd
expect 711 clusters of data. But NO! - as is well-known there's only 709
clusters available for data. What has TOS done with the other 2? I'm sure
I don't know - I've never seen any explanation for this documented! But
there _MAY_ be a good reason - and, IN CASE THERE IS, and in any case
as this software is FREEWARE, I give NO GUARANTEES WHATSOEVER for any
consequences that might arise out of using RECLAIM. Therefore, it would
be wise to be wary (esp. with valuable data) until one has gained full
confidence in the usage of RECLAIM. All I can say is that I have
personally been using RECLAIM for some while with no adverse-effects.

The idea for RECLAIM is originally in the RDY sourcecode of Mark
Williams Co.'s "RDY" ramdisk utility. Whilst upgrading the latter recently
(Version_4 of RDE is now available at a.a.) I noticed that a little trick
which the author of RDY called a CLUSTERHACK allowed the ramdisk to reclaim
these 2 lost clusters back from TOS. Basically the strategy is exceedingly
simple viz. alter the boot parameter block info to signal a total sector
number which is 4 more than actually exists and to MARKBAD the last two
FAT clusters. It occurred to me that this might also work on Floppies
and, indeed, it seems to. However I know of no formatter program that will
format floppies in this "RECLAIMed" state.

You can use a disk editor (DISK DOCTOR, KNIFEST etc.) to do the
alterations. However, altering the format with a disk utility involves some
intricate calculations to locate the last two fats' positions etc. etc.
and a small error could cause loss of data. RECLAIM.TOS simplifies & speeds
up this task. At the prompt you simply insert a normally formatted disk
and RECLAIM will do these conversions and modify the disk so that you will
end up with 2 kbytes more of free space on it. Of course, it checks to see
if the disk has previously been altered and, in that event, will tell you
and alter nothing. Note also that disks containing data can also have

their missing sectors RECLAIMed - with no harm to the data.

etc. etc. .... Rest of documentation ommitted.

3175. Falcon ?

Here is a technical comparison between Atari's new Falcon 030 and
Commodore's new Amiga 1200. Both of these manufacturers are well known
in Europe, yet neither has made a huge impact on the IBM\Apple dominated
United States. Will either of these new model's get their makers
recognition in the states?

Atari Falcon CBM Amiga 1200
CPU 68030 68EC020

recording misc utilities
Audio Fun Machine- Deluxe Paint AGA
FX processor (limited offer)
misc utilities & Word Processor
games (limited offer)

PRICE(retail) $799.00 $699.00

FINAL NOTES: Both of these machines are housed in a single case. They DO NOT have detached keyboards. The Atari Falcon is in the same case as it's predesessor the 1040STE, and the Amiga 1200 is in a restyled case similar to the Amiga 500. Rumours are that the Falcon will get a new case in the Spring, although this has not been confirmed.
As of this writing(2/8/93), only the Amiga 1200 is currently available in the U.S., and in limited quantity. The going street price has been $600.00 with no hard drive & $850.00 with a 40 meg internal hard drive. Many dealers, however, will install larger drives upon ordering. Third party developers have also released CPU,FPU and RAM expansion boards. Most notably, GVP's 1230, with a 40mhz 68030, FPU

socket and room for 32megs of SIMM RAM, starting at $400.00.
The Atari Falcon was expected in January, however, its release in
the states has been delayed until March. It has been available in Europe
in limited supply. The Falcon is the first low cost home computer to
include a DSP. The NEXT computer is the only other computer with a DSP,
and it uses the same Motorola 56001 as the Falcon. Several expansion
products have been announced that use the DSP port, including: voice
mail & audio hard disk recording products. An internal IBM emulator card
has also been announced.

Hi folx! I thought this might interest some people.. esp. those who want
to write low level device drivers, and TSR's.. and maybe it will help clear
up some questions about the Falcon, but i think more questions will be
caused because of it.. but oh well :^)

I am open to comments, questions, etc..
Flames will be cheerfuly filed away in /dev/null

-Dan

$FF8781|byte |Contents of SCSI-Data buses |R/W (TT)
$FF8783|byte |Init-Command Register |R/W (TT)
$FF8785|byte |Transfer Start Register |R/W (TT)
$FF8787|byte |Target-Command Register |R/W (TT)
$FF8789|byte |Bus Status Register |R/W (TT)
$FF878B|byte |Status Register |R/W (TT)
$FF878D|byte |Command Data from SCSI-Bus |R/W (TT)
$FF878F|byte |Reset DMA/Parity error/begin DMA transfer |R/W (TT)
-------+-----+-------------------------------------------+----------
###############YM2149 Sound Chip ############
-------+-----+-------------------------------------------+----------
$FF8800|byte |Read data/Register select |R/W
| |Port A (register 14) BIT 7 6 5 4 3 2 1 0|
| |IDE Drive On/OFF ------------' | | | | | || (F030)
| |Monitor jack GPO pin ----------+ | | | | ||
| |Internal Speaker On/Off -------' | | | | || (F030)
| |Centronics strobe ---------------' | | | ||
| |RS-232 DTR output -----------------' | | ||
| |RS-232 RTS output -------------------' | ||
| |Drive select 1 ------------------------' ||
| |Drive select 0 --------------------------' ||
| |Drive side select -------------------------'|
| |Port B - (register 15) Parallel port |
$FF8802|byte |Write data |W
| +----------------------------------------+
| |Note: PSG Registers are now fixed at these|
| |addresses. All other addresses are masked|
| |out on the Falcon. Any writes to the shadow|
| |registers $8804-$8900 will cause a bus error|
-------+-----+-------------------------------------------+----------
###############DMA Sound System ############
-------+-----+-------------------------------------------+----------
$FF8900|byte |Buffer interrupts BIT 3 2 1 0|R/W (F030)
| |TimerA-Int at end of record buffer --' | | ||
| |TimerA-Int at end of replay buffer ----' | ||
| |MFP-15-Int (I7) at end of record buffer -' ||
| |MFP-15-Int (I7) at end of replay buffer ---'|
```

```
-------+-----+-------------------------------------------+----------
$FF8901|byte |DMA Control Register BIT 7 . 5 4 . . 1 0|R/W
| |1 - select record register --+ | | || (F030)
| |0 - select replay register --' | | || (F030)
| |Loop record buffer -------------' | || (F030)
| |DMA Record on --------------------' || (F030)
| |Loop replay buffer ----------------------' || (STe)
| |DMA Replay on ----------------------------'| (STe)
-------+-----+-------------------------------------------+----------
$FF8903|byte |Frame start address (high byte) |R/W (STe)
$FF8905|byte |Frame start address (mid byte) |R/W (STe)
$FF8907|byte |Frame start address (low byte) |R/W (STe)
$FF8909|byte |Frame address counter (high byte) |R (STe)
$FF890B|byte |Frame address counter (mid byte) |R (STe)
$FF890D|byte |Frame address counter (low byte) |R (STe)
$FF890F|byte |Frame end address (high byte) |R/W (STe)
$FF8911|byte |Frame end address (mid byte) |R/W (STe)
$FF8913|byte |Frame end address (low byte) |R/W (STe)
-------+-----+-------------------------------------------+----------
$FF8920|byte |DMA Track Control BIT 5 4 . . 1 0|R/W (F030)
| |00 - Set DAC to Track 0 ---------+-+ | ||
| |01 - Set DAC to Track 1 ---------+-+ | ||
| |10 - Set DAC to Track 2 ---------+-+ | ||
| |11 - Set DAC to Track 3 ---------+-' | ||
| |00 - Play 1 Track ----------------------+-+|
| |01 - Play 2 Tracks ---------------------+-+|
| |10 - Play 3 Tracks ---------------------+-+|
| |11 - Play 4 Tracks ---------------------+-'|
-------+-----+-------------------------------------------+----------
$FF8921|byte |Sound mode control BIT 7 6 . . . . 1 0|R/W (STe)
| |0 - Stereo, 1 - Mono --------' | | ||
| |0 - 8bit ----------------------+ | ||
| |1 - 16bit (F030 only) ---------' | || (F030)
| |Frequency control bits | ||
| |00 - Off (F030) -------------------------+-+| (F030)
| |00 - 6258hz frequency (STe only) --------+-+|
| |01 - 12517hz frequency ------------------+-+|
| |10 - 25033hz frequency ------------------+-+|
| |11 - 50066hz frequency ------------------+-'|
| |Samples are always signed. In stereo mode, |
| |data is arranged in pairs with high pair the|
| |left channel, low pair right channel. Sample|
| |length must ALWAYS be even in either mono or|
| |stereo mode. |
| |Example: 8 bit Stereo : LRLRLRLRLRLR |
| | 16 bit Stereo : LLRRLLRRLLRR (F030) |
| |2 track 16 bit stereo : LLRRllrrLLRR (F030) |
-------+-----+-------------------------------------------+----------
###############STe Microwire Controller (STe only!) ###########
-------+-----+-------------------------------------------+----------
```

```
$FF8922|byte |Microwire data register |R/W (STe)
$FF8924|byte |Microwire mask register |R/W (STe)
| +----------------------------------------+
| |Volume/tone controller commands(Address %10)|
| |Master Volume 10 011 DDDDDD|
| |Left Volume 10 101 xDDDDD|
| |Right Volume 10 100 xDDDDD|
| |Treble 10 010 xxDDDD|
| |Bass 10 001 xxDDDD|
| |Mixer 10 000 xxxxDD|
| +----------------------------------------+
| |Volume/tone controller values |
| |Master Volume : 0-40 (0 -80db, 40=0db)|
| |Left/Right Volume : 0-20 (0 80db, 20=0db)|
| |Treble/bass : 0-12 (0 -12db, 12 +12db)|
| |Mixer : 0-3 (0 -12db, 1 mix PSG)|
| | (2 don't mix,3 reserved)|
| +----------------------------------------+
| |Procedure: |
| |Set mask register to $7ff |
| |Read data register and save original value |
| |Write data register |
| |Compare data register with original value, |
| |repeat until data register returns to |
| |original value to ensure data has been sent |
| |over the interface. |
| +----------------------------------------+
| |Interrupts: |
| |Timer A can be set to interrupt at the end |
| |of a frame. Alternatively, the GPI7 (MFP |
| |mono detect) can be used to generate |
| |interrupts thereby freeing up Timer A. In |
| |this case, the active edge $FFFA03 must be |
| |set by or-ing the active edge $FFFA03 with |
| |the contents of $ff8260 as follows: |
| |$FF8260 - 2 (mono) or.b #$80 with edge |
| |$FF8260 - 0,1 (colour) and.b #$7f with edge |
| |This will generate an interrupt at the START|
| |of a frame, instead of at the end as with |
| |Timer A. To generate an interrupt at the END|
| |of a frame, simply reverse the edge values. |
-------+-----+-------------------------------------------+----------
